A COMPARATIVE STUDY OF THE READING DISABILITY IN
NEUROLOGICALLY ORGANIZED AND NEUROLOGICALLY
DISORGANIZED FIFTH GRADE CHILDREN

by

Sister Mariam, O.P.

A Dissertation Submitted to the Faculty of the Graduate School
Of Loyola University in Partial Fulfillment of
the Requirements for the Degree of
Doctor of Philosophy
January
1965
ACKNOWLEDGMENTS

The author wishes to express gratitude to Mother Benedicta, O.P., Superior General of the Dominican Sisters for the opportunity to do graduate study.

She is also indebted to religious women of many communities and to lay teachers with whom she has been privileged to work. They provided inspiration, encouragement, and support on many occasions.

Not the less significant are the children in schools visited by the author whose growth in reading was one of her major concerns.

Sincere appreciation is due Dr. Arthur O'Mara and other members of the Loyola University faculty for their interest, their fine qualities of scholarship and leadership as well as their aid in the preparation of this dissertation.

Finally many persons shared in the tedious aspects: cooperating with the administering of the tests; scoring and checking them; and typing the manuscript. To these persons the author is most grateful.

CHAPTER I

INTRODUCTION

One of the most stimulating experiences in working with teachers and children in the area of reading instruction at the elementary level is being witness to the improvement in teacher competence. It is encouraging to find young boys and girls achieving close to their potential, to see them moving from one level of development to another with ease and assurance, to witness vocabulary growth, and to feel the impact that library reading effects in a classroom. These are positive rewards a reading consultant experiences as she works in schools of differing socio-economic background with children of varying potential.

But there is another side of the coin. In almost every classroom there is a population not responding to the prepared teacher, not meeting the goals of learning anticipated by following and enriching a textbook sequence.

Children with intellectual deficits may constitute a majority of any school's population of slow readers. On the other hand, it is feasible that many children develop (or bring with them) personality problems which hinder academic instruction from making its mark. Other causes have been suggested for reading retardation, including environmental deprivation, absence of motivation, inadequate instruction and crowded classrooms. However, in the absence of these causes there remains a large percentage of children who cannot
read on a level commensurate with their intelligence. It is precisely these children whom we study for additional clues to their reading problems, for it is quite possible that they have dyslexia or a problem of such a specific nature as to merit the term "specific language disability."¹

The motive for this study developed from interest in children with reading disability and in the teachers working with these children. In spite of the tremendous strides that have been made during the last fifty years in methods of teaching and in diagnostic and remedial procedures, a surprisingly large number of children still make slow progress in reading achievement. Many of these children appear to have adequate sensory efficiency for reading, and their intelligence, experience backgrounds and language ability compare favorably with those of other children of the same chronological age who are reading well.

A survey of the research studies in the area of laterality and directionality point up the confusion that poor readers experience in these functions. "Since 1925, a number of published accounts have emphasized the etiological relationship of two factors to reading disability. These factors, largely physiological in nature, are (1) vertical and lateral imbalance of the eye muscles (alleged to result in incoordinate binocular vision), and (2) mixed cerebral or mixed ocular and manual dominance (alleged to cause the reversals, faulty eye-movements, and other difficulties which characterize poor readers)."² Currently, the work of Dr. Carl Delacato of the Institutes

for the Achievement of Human Potential in Philadelphia is renewing the interest in neurological organization as a clue to reading disability in children.

In the literature of reading disability there have appeared a number of studies purporting to show an etiological relationship between certain conditions of laterality (sidedness) and poor reading. The "frequent association" of left-handedness and dyslexia has been emphasized in some investigations. Left eyedness has been associated with poor reading by others. Finally, one author has hypothesized causal relationships between mixed eye-hand dominance (left-handedness and right-eyedness) and legasthenia.

The most widely discussed theory of dominance is that of Dr. Samuel Torrey Orton, a neurologist. He asserted that if a person fails to develop a consistent dominance of one side over the other, difficulties arise. In such a case, according to Orton, there will be confusion and conflict between the two sides of the brain. The child will have great difficulty in learning to read and spell and reversal errors will be present. It was really Dr. Orton's theory and investigation which served as a foundation and gave strength to Dr. Delacato's interest in the neurological aspect of reading disability. This in turn proved to be the spark for this investigator.

The present study had two purposes: (1) to ascertain the incidence of neurological disorganization present in fifth grade children reading below grade level; and (2) to compare the patterns of reading disability of children

---

5Dearborn, op. cit., XXXI, p. 634.

who are neurologically disorganized with those who are neurologically organized.

It is hoped that the present investigation will throw further light on the relation of neurological organization to reading disability, point out the incidence of neurologically disorganized children, provide further insight into the types of reading disability, and give direction to consultants and teachers in how to adjust instruction for children who are neurologically disorganized.

The study was planned and conducted to test the following hypotheses:

1. The results of the testing for neurological organization will show a greater incidence of poorly organized children than of well organized children in fifth grade reading disability cases.

2. The pattern of reading disability as measured by the Iowa Test of Basic Skills and the Silent Reading Diagnostic Test will differ for children who are well organized and for those who are poorly organized neurologically.

3. The neurological realm will be indicated as a potential etiological factor in poor language and reading development.

Procedure of the investigation.—This investigation proposes to study the pattern of reading difficulties of children reading below grade level in schools of differing economic environments. Schools were selected in neighborhoods determined to be high economic, middle class, and low or poor economic class. Social classes were defined by examining the occupational position of the parents of the children, the residential area from which the children came and the level of educational attainment of the parents. Fifth grade children were selected because by their chronological age these children should have established clear patterns of neurological organization. They had been placed on levels through previous standardized tests, informal reading inventories, and the judgment of the teacher based on their actual daily performance. The
opinion of the investigator supported the results of the tests and it was agreed by the teacher and the reading consultant that the children were properly placed for reading instruction.

To form the conceptual framework for the study a testing program was conducted. A new set of tests, none of which had been administered during the academic year, was selected to provide the following data for each child:

1. The index of brightness or innate potential as far as can be measured by standardized instruments. For this purpose the Lorge-Thorndike Intelligence Test: Non-Verbal Battery was selected and administered.

2. The present level of reading achievement as determined by standardized reading tests. For this purpose the Iowa Test of Basic Skills was administered.

3. Since these children were already known to be experiencing difficulty in reading performance, another test, the Silent Reading Diagnostic Test, by Bond, Clymer and Hoyt was administered. This would attempt to provide a further breakdown of the type of difficulties children experience.

4. An inventory of neurological organization was given to each child to ascertain handedness, eyedness, footedness. Tests of cortical opposition, supination and pronation as well as level of creeping efficiency were also given. The Doman-Delacato Scale was used and administered to each child individually.

After the tests were administered and scored the data compiled arranged the children into two categories:

1. Group A. Fifth grade children reading below grade expectancy as measured by the Lorge-Thorndike Intelligence Test. The children in Group A were those classified as well-organized neurologically as measured by the Doman-Delacato Scale.
Group B. Fifth grade children reading below grade expectancy as measured by the Lorge-Thorndike Intelligence Test. These were the children who were poorly organized neurologically as measured by the Doman-Delacato Scale.

A population of 203 fifth grade children was selected from schools in three differing socio-economic areas of Chicago. This population represented negro and white children for whom English was the native language.

This research was designed to determine the incidence of neurologically poorly organized children in reading disability cases and also to determine if reading disability in neurologically disorganized individuals differs in any significant way from reading disability in individuals who are neurologically well organized.

Explanation of the Terminology

It is a matter of considerable importance that there exist an understanding of the terminology used in this study.

Language disability: The children in the study were selected because they are language disability problems. Marion Fenwick Stuart,7 in Neurophysiological Insights into Teaching presents a diagnostic breakdown of language difficulties in the following outline:

A. Non-specific language disability

1. Poor intellectual endowment
2. Basic emotional disturbance

These conditions constitute a learning disability. In such cases, probably all school work suffers; reading, spelling and writing problems are non-specific to the learning disability.

B. Specific language disability

This constitutes a language disability. In this case, reading, spelling, writing problems are specific. This is the child who may

say he could learn if someone would read to him, or if someone would listen to him "say back" his lesson, rather than require him to write it down. It is easily understood that his language problems give rise to emotional problems which are secondary to the primary problem of specific language disability.

C. Other causes for language difficulties include:

1. Frequent absence.
2. Frequent change of schools.
3. Poor teaching.
4. Speech disorders.
5. Physical illness, and eye and ear defects.
6. Brain damage.
7. Factors in the environment.

Neurological organization: A sequential continuum, which ends at about the age of six, or at about the age when reading is generally taught formally. It includes the following stages:

Medulla: This is the stage at birth where we see movement of arms and legs without bodily movement: the cry, grasp reflex, light reflex, startle reflex, Babinski reflex (the upper extension of the toes when the sole is flexed).

Pons: This is the stage from about three to twenty weeks. Here is seen a basically one-sided level of function. Mobility is homolateral or one side used for propulsion at a time; vision is biocular; audition is biaural. Crawling in a prone position culminates in cross-pattern crawling.

Mid-brain: This is the stage from about seven to nine months of age. As the child moves, opposite appendages are used for propulsion. As he moves, the right hand and left knee are used at one time and then the left hand and right knee are used for propulsion. He has become a cross-patterned organism. He no longer is one-sided, but now is distinctly two-sided. He becomes a bilateral human being. He experiences binocularity or the use of two eyes in concert, and he is
binaural, or uses two ears in concert.

Cortex: This is the stage at about ten months of age. Stereo or depth within receptive and expressive mobilities, cross-pattern walking, cortical opposition in either hand, convergence of vision and stereo functions lead to the level of the development of complete cortical hemispheric dominance.

Later cortex period: This stage continues from ten months to six years or older and refines the actions of the cortex period.

The following aspects of this period may be considered:

Mobility: Walking with arms freed; walking and running in a cross-pattern; using a leg in a skilled role which is consistent with the dominant hemisphere.

Language: Skill in this area grows from using two words spontaneously, to two-word couplets, to short sentences and finally to complete vocabulary and proper sentence structure.

Manual competence: This is manifest first in cortical opposition in either hand, then bilaterally and simultaneously; bimanual function with one hand in a dominant role; using a hand to write which is consistent with the dominant hemisphere.

Visual competence: This is convergence of vision resulting in simple depth perception; identification of visual symbols and letters within experience; reading words using a dominant eye consistent with the dominant hemisphere.

Auditory competence: Here there is a growth from understanding two words of speech, then 200 words and simple sentences, finally to complete vocabulary and proper sentences with the proper ear.
Tactile competence: The child experiences tactile understanding of the third dimension in objects which appear to be flat; description of objects by tactile means; tactile identification of objects using a hand consistent with hemispheric dominance.8

Dominance: (1) Cerebral dominance: When used by physiologists without further qualifications this refers to the increasingly important role played by the cerebral cortex, as the animal scale is ascended, in controlling and integrating the activities of the lower nervous centers such, for example, as the cerebellum and the spinal cord. (2) Unilateral cerebral dominance: When used with this qualifying adjective the expression refers to the concentration of functional control of language in one half of the brain such as is revealed by the fact that speech, for example, may be entirely lost although only one hemisphere of the brain has suffered injury. (3) Eye dominance: One eye which is habitually used for sighting is referred to as the dominant or the master eye. The children in the study were tested to determine the dominant eye or eyedness.

Footedness: Consistent preferential use of either the right or left foot for such unilateral functions as kicking, hopping, starting upstairs, etc.

Handedness: Consistent use of either the right or the left hand in skilled acts such as cutting with a scissors, grasping, eating, brushing the teeth, etc.

Sinistral: Left; also used as an abbreviation for a left-handed person.

8 Carl Delacato, The Ontogeny of Reading Problems, Institute of Language Disability, Philadelphia (Philadelphia: By the author). Many of the ideas in this work are taken and supplemented in books by the author to be quoted later.
Sinistrad; to or toward the left.

Dextral: Right; also used as an abbreviation for a right-handed person.

Dextrad: toward the right side or hand or in the right-handed direction.

Laterality: Sidedness. We say a child is well lateralized when he is consistently either right-eyed, right-handed and right-footed or left-eyed, left-handed and left-footed.

Dyslexia: Defective reading. The reading defect may represent loss of competency following brain injury or degeneration; or it may represent a developmental failure to profit from reading instruction. ⁹

⁹ Orton, loc. cit. (New York: W. W. Norton and Company, Inc., 1937). The definitions were checked in Dr. Orton's work because of the value of his work as professor of neurology and neuropathology at Columbia University. Many of the subsequent studies used his work as a springboard either in whole or in part.
CHAPTER II

CONCEPTUAL FRAMEWORK OF THE STUDY

Since reading forms so early an acquisition in academic education, and since facility in this subject is usually acquired even by children who quite obviously are below average in brightness, we are prone to assume that any child who is not grossly defective in intelligence can learn to read. Like all generalities this assumption has its exceptions. That certain physical defects such as very faulty vision or hearing may serve as a hindrance to easy acquisition of reading is self evident. It requires more explanation when the statement is made that children with normal or even superior intelligence and with normal vision and audition and even with normal use of ordinary pictorial material may have great difficulty in learning to read, or may even prove to be unable to learn from ordinary teaching methods. This statement is, however, demonstrably true and suggests a problem on which the neurologist may throw some light.

It is for this reason that we turn to the work of Dr. Samuel Orton who from the first was strongly impressed with the idea that specifically retarded readers formed a homogeneous group who differed only in the degree of handicap and not in type.¹ He was convinced that the nature of errors in

¹Ibid., p. 12.
Orton's theory was a startling one to the educators who heard it. He maintained that the explanation of the causes of the handicap rests on well-known facts of brain anatomy and brain pathology. Unlike many of the organs of the body, the brain is made of two symmetrical halves or hemispheres separated from each other by a deep cleft or fissure and connected only by a massive bridge of fibers. It is more nearly comparable to the two arms than to the heart or liver, and this simile may be carried further since the two hemispheres are exactly like each other but are an antitropic right and left like the two hands. We recognize that structurally these two halves are quite distinct, at the same time we know that they do not work as separate units. Nor are their relations to each other exactly the same in the various functions in which the brain participates. For example, the way the two halves function in control of voluntary motion is not like the way in which they function in the reception of visual impressions, and in neither of these is their relation to each other the same as in reading and writing.

In speaking of control of voluntary motion, each hemisphere acts on the opposite side of the body exclusively. Though there is exceedingly close coordination between movements of right and left hands, for example, each is independently governed by nerve cells situated in a narrow strip of gray matter, the so-called motor area, of the opposite hemisphere. This independence of the two sides is shown when disease or injury destroys the motor area of one hemisphere. This results in a loss of voluntary movement of
the opposite half of the body but does not interfere with voluntary movement on
the same side.

As early as 1925, Samuel Orton was investigating the neurological
organization of man and pointing to the importance of consideration of man's
superiority over animals in the area particularly of speech and locomotion. In
Reading, Writing and Speech Problems in Children, published later in 1937,
Orton had these remarks to make:

Man's dominant position in the animal world rests largely if not entirely
on his possession of two faculties: first, his ability to make use of
sound, markings, and gestures for the purpose of communicating with others
of his kind and as a background for his own ideation, and, second, the very
high degree of skill which he has developed in the use of his hands since
they were freed from the duties of support and locomotion, by the abandon-
ment of the arboreal habit and adoption of the erect posture. In most of
the simpler functions of the nervous system man is inferior to animal
competitors. Mention need only be made here of the superiority of most
mammals in the sense of smell, of the strikingly greater acuity of vision
possessed by the soaring birds of prey by virtue of their second macula, of
the exquisite vibratory sense of many fish, and of the fact that certain
insects — notably the honeybee — are capable of responding to light waves
in the ultra-violet which are well beyond the range of human vision. It is
therefore of arresting interest to note that in the two faculties whence
man's superiority derives — speech and manual dexterity — a highly novel
physiological pattern has been evolved in the brain whereby the functional
control of these faculties is restricted sharply to one of the two cerebral
hemispheres — a plan of activity in sharp contrast to that existing in the
lower functional units of the central nervous system where exact bilateral
symmetry is the rule. 2

An interesting fact and one which seems to be of major meaning in
understanding the language disorders of children is that one side of the
brain is all important in the language process and the other side either use-
less or unused. This is most striking when we reflect that a very small area
of destruction in an appropriate area of the controlling or dominant
hemisphere of the brain will give rise to extensive loss in speech or reading
while an equal area of destruction in exactly the same part of the non-

2Ibid., p. 13.
dominant hemisphere will be followed by no language disorder whatsoever. This concentration of the whole control of speech, reading and writing in one half of the brain bears an intimate relation to the development of unilateral manual skill in the individual and is the unique pattern which has contributed much to give man his commanding position in the animal world. It is this development of unilateral manual skill in children that appears to be, in some cases, a contributing factor to success in reading.

In 1935 a committee for The National Conference on Research in Elementary School English published abstracts of twenty-four studies containing suggestions for the analysis of reading disability. The problem of laterality was investigated by four members. Although the results of the studies are by no means conclusive, several investigators believed that there is little, if any, relationship between reversal errors and mixed hand-eye dominance. Therefore, the significance of the factor of mixed eye-hand dominance in poor reading is naturally questioned despite the emphatic conclusions and assertions of Dearborn, Orton and Monroe. Some investigators, with seemingly insufficient evidence, continue to emphasize the importance of lateral eye-muscle imbalance and fusion imperfections in reading.

Witty asserts that certain physiological factors, obviously accompanying reading disability, but not yet found by group analyses to differentiate poor from good readers should receive attention in the individual diagnosis which should precede effective remedial endeavor.

3 Several investigators support this theory, including Arthur Gates, C. Woody and J. Phillips. Lorene Teegarden's studies of clinical identification of the non-reader also maintains this point.

4 This theory was supported primarily by B. Crider, C. A. Selzer and Betts. Some of their studies will be referred to later in the paper.

5 Paul Witty, loc. cit., p. 458.
Studies Concerning Handedness

Several researchers have contributed valuable information about handedness which is pertinent to this investigation.

Studies made by Gesell and Louise Ames assume that handedness is an extremely complex trait which is intricately bound up with the total action system of the child. Accordingly, it becomes important to inquire into the various developmental expressions of laterality, and to approach the whole subject from the standpoint of ontogenetic patterning and organization. Gesell offers a schematic sequence of major forms of handedness - the characteristic age shifts in the handedness of subjects all of whom eventually showed clear-cut right handedness. The information may be easily reported in the following chart format:

<table>
<thead>
<tr>
<th>Age</th>
<th>Form of Handedness</th>
</tr>
</thead>
<tbody>
<tr>
<td>16-20 weeks</td>
<td>Contact unilateral and, in general, tends to be with the left hand.</td>
</tr>
<tr>
<td>24 weeks</td>
<td>Definite shift to bilaterality.</td>
</tr>
<tr>
<td>28 weeks</td>
<td>Shift to unilateral and oftenest the right hand is used.</td>
</tr>
<tr>
<td>30 weeks</td>
<td>Shift again to bilateral.</td>
</tr>
<tr>
<td>32 weeks</td>
<td>Bilateral dropping out and unilateral coming in. Left predominates in the majority.</td>
</tr>
<tr>
<td>40-48 weeks</td>
<td>Same type behavior, unilateral, but now the right predominates in the majority.</td>
</tr>
<tr>
<td>48 weeks</td>
<td>In some a temporary, and in many a last shift, to use of the left hand - as well as use of right - either used unilaterally.</td>
</tr>
<tr>
<td>50-56 weeks</td>
<td>Shift to clear unilateral dominance of right hand.</td>
</tr>
<tr>
<td>80 weeks</td>
<td>Shift from rather clear cut unilateral behavior to marked, interchangeable confusion. Much bilateral and use of non-dominant hand.</td>
</tr>
</tbody>
</table>
2 years Relatively clear cut use of the right hand.
2½-3½ years Marked shift to bilaterality.
4-6 years Unilateral, right-handed behavior predominates.
7 years Last period when left hand, or even both hands bilaterally, are used.
8 years Unilateral right once more.⁶

Ames in a similar report of the characteristics of age shifts in handedness points out that bilateral behavior, though occurring to some extent at nearly all ages, tends to occur outstandingly in the normal infant and child at certain definite age periods. The fact that patterned alternation of periods of bilateral and unilateral manual responses seems to be characteristic of all subjects studied suggests that periods of bilaterality occur as a result of developing inner forces. These periods occur regardless of postural orientation (that is, whether the child is seated or supine); and by the fact they occur in leg as well as in arm behavior.⁷

Gertrude Hildreth made a concise and scholarly contribution to research by means of her study, "The Development and Training of Hand Dominance." The study dealt with (1) characteristics of handedness; (2) developmental tendencies in handedness; (3) origins of handedness and lateral dominance; (4) developmental problems associated with handedness; and, (5) the training of handedness.

In speaking about the characteristics of handedness, Hildreth points that every normal person is endowed with two arms and hands which serve for the

manipulation of tools and other manual activities. In early life the child apprehends his environment largely through the cooperation of eye and hand; perhaps for this reason the hand has been described as the instrument of the mind, a tool that surpasses in its flexibility, power, and strength any other tool in existence. The hands execute impulses from the brain by means of nerve tracts which activate the efferent muscles. These reactions may be on an automatic, reflex level or consciously controlled by thought. The latter tend to be more complex activities, more elaborately patterned, less readily habituated or newer than the former. Although organically the brain is structured with two halves or hemispheres which are connected by nerves and muscles to the opposite-sided limbs, functionally the brain operates as a unit and the entire cerebrum is involved in motor responses. Manual habits and adaptation reflect the individual’s mental processes and reveal mental and physical anomalies of function.

In the normally sighted person, through a process of mental and physical development, the eyes and hands function coordinately. Oculomotor control is a prominent feature of dextrous movements and characterizes our most highly specialized manual skills. Even in small children the eyes begin to guide the hands; by the time adulthood is reached the eye and hand have become a highly efficient team for intricate psycho-motor performance.\(^8\)

Significant indeed, are the concluding remarks of Hildreth in the section of her study on the training of handedness.

Most children grow up and continue through life without much attention to their handedness, yet this is a phase of child training which should concern

---

everyone who is responsible for rearing and educating children. Not all children develop consistent sidedness and avoid uncertainty and confusion in hand usage with the same degree of efficiency. The matter may receive no attention at all, however, unless the child's development has been particularly difficult. By suitable training it may be possible to reduce the number of cases of speech disturbances, failures in writing and reading, vocational motor handicaps, and cases of social embarrassment attributable to manual deficiency.

The author reminds us that no one has yet proved that eyedness cannot be changed or does not change with shift in handedness. There has been little research on this point. The question is whether it would not be advisable to change dominant eyedness along with handedness. The evidence suggests that consistent eye-hand dominance is far less essential to skilled motor performance than hand dominance alone. Hildreth concluded that the best thing to do would be not to attempt to influence eye-dominance. The questions she had in regard to this conclusion seemed apparent. 9

Helen Lois Kooh reports a study of the nature, measurement and determination of hand preference. The manual choices in 105 situations of 201 university students were studied by means of observation of actual behavior and by means of a questionnaire paralleling these observations. The findings of her study that are pertinent to this investigation are summarized in this statement:

"Our results suggest that hand preference is a trait influenced by many variables among which are probably: instruction, example, convenience, obviousness of choice, previous habits, specific nature and familiarity of the tasks to be performed, hand strength, and genetic factors. The method of measuring strength of preference profoundly influences the results obtained." 10

R. H. Ojemann, in his doctoral dissertation, investigates these three aspects of handedness:11

(1) The method of testing unimanual handedness.

(2) The results obtained in testing bimanual handedness and the relation of bimanual handedness to unimanual handedness.

(3) The results obtained in the investigation of the effect produced upon the speech function by training left-handed individuals to write with the right hand.

For the first part of the study the following summary was made:

(1) A single test such as the tapping test, the ball-throwing test, the paper-cutting test, the needle-threading test or the block-packing test cannot be used to differentiate accurately between the various unimanual handedness groups. On each test there is considerable overlapping of the scores made by the left-handed individuals with the scores made by the ambidextrous subjects, and similar overlapping of the scores made by the ambidextrous subjects with the scores made by right-handed individuals.

(2) If, however, the scores on an increasing number of tests are combined, the overlapping of the scores tends to decrease. When scores on the five tests—tapping, paper-cutting, ball-throwing, block-packing and needle-threading—are combined, the overlapping of the scores made by the left-handed, ambidextrous and right-handed individuals is relatively small.

(3) When the combined scores on the five unimanual tests for an unselected group are presented graphically, the resulting curve is distinctly bimodal. Handedness appears, therefore, to be a general factor which tends to divide individuals into two groups. Relatively few individuals are ambi-

dextrous. Individuals tend to cluster about a right-handed tendency or a left-handed tendency. This finding tends to indicate that handedness is an inherited characteristic. There is no environmental factor which would account for the bimodal distribution of handedness found in this study.

In the second section bimanual handedness was tested. Four bimanual tests were used: sweeping, raking, shoveling, and batting. If the subject held the right hand nearer the business end of the instrument and did the work on the right side of the body, a score of right was given. Left was recorded for the opposite action. In his summary Ojemann notes these two points:

(1) The customary classification of handedness as applied to such activities as sweeping, raking, and shoveling is in error. According to the customary classification, the majority of the human race is left-handed in these activities, and bimanual handedness varies inversely with unimanual handedness. When the customary classification is reversed, the majority of individuals is designated as right-handed and the direct relationship of bimanual handedness to unimanual handedness is at once apparent.

(2) The handedness in bimanual activities varies somewhat with the nature of the activity, as sweeping is more closely related to the handedness in such activities as raking and shoveling than to the handedness in such an activity as batting.

In addition to the unimanual and bimanual handedness tests each dextrosinistral was given three speech tests: (1) an articulation test; (2) a spontaneous speech test; and (3) an oral reading test. The data presented in this study show however, that under ordinary conditions, the danger of producing a speech disturbance after the speech habits have been formed by training a left-handed child to write with the right hand is very slight. The nervous system is sufficiently flexible to allow an individual
having a strong left-handed tendency to be trained to develop the complex coordination required for writing with the right hand without bringing about a disturbance in a closely related series of fine coordinations such as are involved in speech. 12

Clifford Woody and Albert Phillips also investigated handedness in an attempt to reveal the differences in the responses of right and left-handed children to various situations involving skills emphasized in reading or activities closely related to reading. The investigation involved 136 pairs of right-and left-handed pupils matched according to the following categories: (1) sex, (2) chronological age, (3) mental age, (4) reading ability, and (5) section of a grade with the same teacher in the same school.

The one outstanding conclusion derived from the many comparisons that were made of the responses given to situations in the battery of tests involving reading is that handedness per se had little or no influence on the type of reading responses made. Left-handed children reacted to the various reading situations just as right-handed children did. In these two groups of pupils selected maximum attention was paid to obtaining groups of children who had pure handedness. 13

Ivor Burge approached the problem of handedness from the standpoint of one who is interested in physical education. Consequently his study was more concerned with answers to such questions as,

(1) Is the preferred hand really stronger, faster and more accurate than its partner?

12Ibid.

(2) Does its superiority increase, remain the same, or decrease as the child grows older?

(3) Is the hand which is strong also fast and accurate? As regards the superiority of one hand over its partner, are there any significant sex differences?

A strength test, an accuracy test and a speed test were given each of the 312 primary school children who participated in this study. The tests were administered to groups of three or four children at a time, the testee being matched against each other in an endeavor to produce their best efforts. No indication was given that there was any competition between each child's own hands, but, in every case the children were encouraged to see which of them had the strongest grip, who could throw the straightest, and who could effect the largest number of bounces in the allotted thirty seconds. The more commonly used hand was tested first, but so keen was the competition amongst the children that each attempted to increase the score of the first performance when the other hand was tested.

The summary of the major findings include the following:

(1) In all three tests, the differences between the performances of the right and the left hands was smaller in the dextro-sinistral than it was in the dextral or the sinistral.

(2) The results indicate that there is little or no relation between the three abilities tested.

(3) Dextrals rely more on the right eye than they do on the left, while sinistrals, as a group, rely on the right eye almost as often as they rely on the left.14

Arthur Fitt and K. H. O'Halloran correlated handedness with several aspects of intellectual ability, with psychopathic tendency, and with height and speed of tapping.

In his summary Fitt reports:

(1) The data show a definite correlation between handedness and scholastic ability. Left-handedness seems to be associated with relatively low scholastic ability.

(2) With a group of children of average age twelve to thirteen years, the dominantly left-handed seem to be somewhat more psychopathic than the dominantly right-handed.

(3) Left-handed boys of thirteen to fourteen years seem to be somewhat shorter than the right-handed. There is a slight tendency to reversals at fifteen years with an equally slight tendency to physical dominance of the right-handed group at sixteen years.

(4) No clear relation was found between handedness and speed of tapping except that dextrosinistrals do not appear to be equal to dextrals on their right hand score.  

Finally, in Hildreth's study of reversals in reading and writing, children under standard test conditions indicated a decline in frequency of the tendency in higher as contrasted with lower grades in making reversals. None of the children examined showed a high degree of consistency in the tendency to make reversals. The inconsistency of this reversal tendency prevents a conclusion that reversal tendency is a cause of poor reading.

Studies of Eyedness or Eye Dominance

The two eyes, like most of the paired organs with which man is endowed, are seldom equally efficient. They may differ in many ways, and especially in the manner in which they control muscular co-ordinations.

H. Bannister pointed out from his study in eye dominance that the dominant eye is an important factor affecting ability with the rifle, and that the man whose right eye is dominant has a considerable advantage, other things being equal, over other men when required to shoot from the right shoulder. 17

The purpose of Blake Crider's investigation was to determine whether unilateral sighting preferences (ocular dominance) were related to characteristic differences in the ocular muscle balance of the two associated eyes. Insufficiencies were listed for: (1) the eye which did not converge in the fixation test; (2) the eye which recovered its fixation more slowly on removal of a screen; (3) the eye which converged or diverged in contrast to the eye which maintained its equilibrium; and (4) the eye which made the greatest excursion behind the screen. The relation between unilateral sighting preferences, or eye dominance, and eye muscle insufficiencies is very close. The eye with the muscle insufficiencies is seldom the sighting or dominant eye. It also seems reasonable to believe we have another valuable method for determining eye dominance from this study. 18

---

Gould (1908) advanced the theory that dominant handedness originates in dominant eyedness, and that eyedness is an index of native handedness; but Gould apparently did not collect much evidence concerning eyedness tendencies in the general population. Parsons worked in this area also. According to Parsons, all right-handed, left-eyed individuals are those who were originally left-handed but were forced to change, but the theory does not explain the opposite group, the left-handed, right-eyed individuals. Parsons also asserts that when discrepancies between eye-and-hand dominance occur, the eye dominance may be considered the surer indication of "original" or "natural" laterality, since the handedness tends to change through the growth period far more frequently than eyedness. Eyedness is significant chiefly as an indication of early hand usage. The neurologist Brain does not believe that eyedness plays any part in actually causing handedness.

Hildreth, on whose references we have placed value earlier in this paper, summarized the points on eyedness worthy of note: The dominant eye normally corresponds with the individual's sidedness and lateral dominance in general. Eye dominance is considered to be a significant feature of human development because of the relation between eye-hand functioning and problems of motor adjustment including speech, reading, writing and certain vocational skills. Eyedness is not affected by the visual acuity of the eyes, for in many cases the master is weaker. Eyedness is primarily a matter of motor control. Eye movements develop in infancy ahead of hand movements. The eye tends to control and direct the hands in manipulation activity. The infant gains control over eye coordination before he achieves hand control; it is doubtful whether unilateral sighting develops before hand control. Eye dominance like

handedness increases to some extent with age, suggesting that eye preference is an acquired visual-motor habit and that it is modifiable. Ocular dominance is established in early childhood and, unlike handedness, from then on tends to persist unless the sighting eye becomes incapacitated. Eyedness is not so obvious a trait as handedness, and is not directly trained as in the case with handedness.

Due to the difficulty of studying eye-dominance in infancy and early childhood, the developmental trends in eyedness have not been thoroughly explored at these age levels. Investigation in these early levels would answer many perplexing problems concerning the development of the relation between eye and hand functioning.  

It would appear that high priority be placed on an understanding of the neurological organization (particularly laterality) in children by teachers who attempt to train them to read.

20 Gertrude Hildreth, "The Development and Training of Hand Dominance,
Parts I-V" Journal of Genetic Psychology LXXV and LXXVI (December, 1949; March, 1950). At this point the reader is referred to the five parts of this work because of its value and contribution to the fields of education, psychology and neurology. The work has been referred to in parts earlier in the paper.
CHAPTER III

CONCEPTUAL FRAMEWORK OF THE STUDY (CONTINUED)

In the overall framework there are some studies which move to the foreground and form a pattern of sequence to this present work. They are cited here, not for their agreement, but because they form a line of thinking that contributes to the motivation for this investigation. These authors have influenced educators and psychologists for decades and it is hoped that in viewing their work within the context of the learning process we will perhaps see a value in outlining a method of treatment for the children who fall under the scope of their search.

Orton, a neurologist, suggested the hypothesis that reading disability is due not to an organic defect in the brain but to failure to train the brain to work exclusively from the dominant hemisphere. He discussed the necessity of clear-cut unilateral dominance to prevent confusion. In his early writings he described a diagnostic rationale which evaluated the level of cortical hemispheric dominance. He looked to brain anatomy and brain pathology as an explanation of reading difficulty.¹

With the awareness of neurological problems that Orton contributed and the information that he made available to research students in medicine and

¹Orton, op. cit., p. 17.
education, it is no small wonder that many persons followed his ideas and made them applicable to the learning process. There were many studies undertaken from 1930 through 1960 that concerned themselves with the incidence of crossed dominance in children. No one had suggested a treatment nor a reorganization process for these children with disability until Carl Delacato's work at the present time.

At the same time Orton was making his studies of cerebral physiology of language showing the importance of proper laterality establishment for maximum efficiency in speech, reading and writing, Marion Monroe's classic monograph on reading disability appeared (1932). She studied the incidence of crossed dominance among 101 normal children, 155 disability cases, and forty-four intellectually defective cases. Her final list of fifteen possible causative factors in reading disability includes both defective form perception and insecure directional sense.

Monroe assumed that the first type of disability, "lack of precision in discrimination of complex visual patterns," was reflected in the child's reading in the form of an inability to comprehend words as units although they might be recognized when they were spelled out. The second disability, "lack of precision in discrimination of spatial orientation," was assumed to reflect itself in the static and kinetic reversals described by Orton. However, Monroe merely postulated that these perceptual deficits were significant correlates of developmental dyslexia. She employed no independent measure of form perception or directional sense as they applied to non-linguistic material and did not adduce any empirical evidence that defective perceptual reactions of these types extended beyond the process of reading itself. In contrast, in dealing with such factors as motor speech defects and defective auditory word discrimination, Monroe did show a significant association between these
defects and developmental dyslexia.

The work of Monroe emphasized the objective analysis of errors and the development of specific material to correct these errors. She also placed considerable emphasis on physiological factors. Finally, she attempted to determine specific methods that are adapted to the needs of the individual.  

There followed two research reports which were to be influential in guiding subsequent thinking about the role of higher level visual capacities in developmental dyslexia. The first was Fildes' study in 1921 of visual discrimination and memory in readers and nonreaders. She found that nonreaders showed some degree of disability in visual form discrimination and memory, not on a gross level to be sure, but in the perception of minor differences between visually presented figures. They also experienced difficulty in discriminating identical figures on the basis of spatial orientation alone, e.g., mirror images of the same figure. Similar results were secured in the auditory area; these findings leading her to conclude that developmental dyslexia is but one aspect of a more general defect in either the visual or auditory regions or in both. All the non-readers showed a reduction in the normal power in dealing with forms visually presented - especially when these forms were like each other, their defect being shown most definitely in their failure to remember such forms.  

In sharp contrast to these results of Fildes, quite negative findings were reported the following year by Gates (1922) in his study of the correlates of reading ability in school children. He could find no evidence

---

2Marion Monroe, Children Who Cannot Read (Chicago: University of Chicago Press, 1922) p. 35.

that poor readers differed from good readers in respect to the visual
discrimination of nonlinguistic material and he denied that visual perception
or memory could account for reading disability. Indeed, he denied the validity
of the concept of "general visual perception" asserting that there are abilities
to perceive words, digits, geometric figures, etc., each of which is relatively
independent of other perceptual abilities. Adopting a pluralistic approach, he
implicated poor educational methods, unfavorable home influences, emotional
factors, and defects of vision as determinants of retardation in reading
development. 4

A theory that was forward looking at this time was proposed by Parsons.
The publication of his work on left-handedness disclosed the phenomenon of
unilateral sighting in binocular vision, and definitely raised the question of
the relationship between the dominant eye and the favored hand. Parsons
concluded that in order to avoid difficulties in reading and writing one should
be either left-eyed and left-handed, or right-eyed and right-handed, and
preferably the latter. 5

Parsons 6 further points out that in writing and reading (in our
language) the movement of the hand and the eye are dextrad. It is this
sequence from left to right which has to be followed to build up the correct
visual and kinesthetie images of words. This is the natural and easiest move-
ment of the right-handed - away from the center of the body. Left-handed and
left-eyed children have a preference for the other direction, i.e., sinistrad.
The opposite or dextrad direction is so awkward for them that at the start they

---

6 B. S. Parsons, Left-Handedness. (Chicago, Macmillan, 1924).
appear to "push" the pencil in writing. When lateral dominance has not been established, the trouble is not so easily detected. There is sometimes uncertainty about the correct sequence of letters in words because of conflicting tendencies of hands and eye. The result is that faulty word images with letters interchanged are stored up in the mind which later makes prompt recognition of words almost impossible. Surely here we might expect then to find reading disability among children who are not properly lateralized.

Fernald examined the work of Orton and asked questions about unilateral cerebral dominance. She questioned the correlation between failure to establish unilateral cerebral dominance and reading disability as Orton suggested. She would ask why such dominance had not been established. And what trait it is in the individual that has prevented this dominance from being established under conditions that develop it in the ordinary person. She believed there were fundamental traits that explain the failure on the part of intelligent individuals to develop the brain condition that is essential for learning in connection with quite limited subject matter.

Perhaps what Fernald suggested is more teamwork between neurology and education in offering solutions to the problems met by both. None of the theories seems to explain adequately the failure of certain individuals to learn to read. At least this would be true of the cases of total disability. The data concerning brain function are still inadequate for the formulation of a satisfactory theory of the physiological basis for reading disability.

Later in her treatment of causation of reading disability, Fernald points out that lack of the finer eye adjustments was characteristic of all of her reading disability cases at the start. In her case analyses she always tested for handedness and sometimes for eye dominance, but the latter was not always recorded.
Fernald, in working with reading disability cases and in speaking of eye and hand dominance noted:

The right-handed cases and the cases of matched eye-hand dominance resemble the cases in which the dominance is not matched, are as serious in their deficiency, learn by the same methods, and are as successful in the final outcome. The eye and hand dominance is not changed as a result of the remedial work; that is, the subject with unmatched eye and hand dominance learns to read and is able to read in an entirely normal manner with eye and hand dominance still opposite.\(^7\)

Working with large groups of children, Fernald was in a position to make valid observations which were in variance with the opinion of Monroe. She states:

(1) Corresponding eye and hand dominance is found in many of our cases of extreme disability. In our last fifty cases of extreme disability, forty have corresponding eye and hand dominance, six have mixed eye and hand dominance, and four are ambidextrous. The cases of matched eye and hand dominance resemble the cases in which the dominance is not matched, are as serious in their deficiency, learn by the same methods, and are successful in the final outcome.

(2) In the cases of unmatched eye and hand dominance, the dominance is not changed as the result of remedial work. The subject with unmatched eye and hand dominance learns to read and is able to read in an entirely normal manner with eye and hand dominance still opposite.

(3) A very large number of individuals who have never had the slightest reading disability, many with distinctly superior reading skill, have unmatched eye and hand dominance.

Later in speaking of handedness Fernald says that handedness in itself does not seem to be a sufficient cause for reading disability. She finds no

apparent differences in the type of disability in the right-and left-handed cases. The cases with whom Fernald has worked have not given evidence to support a theory regarding a relationship between handedness, eyedness, and reading disability.  

Gesell in a wholistic approach and study of the developmental nature of the child showed his readers that handedness was a developmental phenomenon and that there were many other indices of neurological maturation in addition to handedness. He assumed in his studies that handedness is an extremely complex trait bound up in the total action system of the child. Since the total system is involved, Gesell urged his followers to inquire into the various developmental expressions of laterality. The phenomenon of the tonic neck reflex as connected with total neurological organization seemed to Gesell to be bound up with earliest manifestations of handedness. The head and neck exert a controlling influence upon the action of the rest of the body. This developmental information of total child growth gave educators solid information on which to note behavior in the subjects with whom they worked. If this developmental data would have been correlated with neurological physiology the result would have been a monumental contribution to the study of child growth.

A study of the relationship between various visuoperceptve skills and reading achievement in first-grade children by Jean Turner Goins deserves mention because its results are being cited as evidence that defective visual form perception and insecure directional orientation are significant determinants of reading disability. In this study a variety of nonverbal

\[8^{8b i d . , \ p . \ 161 .} \]

\[9^{G e s e l l \ a n d \ A m e s . \ l o c . \ c i t .} \]
tests of visual perception, including recognition of similarities and differences in pictures and abstract designs, completing designs from a model and recognition of incomplete pictures, were given to first-grade children relatively early in the school year and repeated later in the school year. Most of the tests correlated positively and significantly with reading level, the coefficients ranging from .2 to .5. Goins also explored the effects of special tachistoscopic training in visual perception on reading level, a procedure which is of particular interest because of its possible implications for treatment. This training, however, had no significant influence on reading performance. 10

Clinical studies of children with varying degrees of reversal tendency done at this time pointed up the following conclusions pertinent to this study:

(1) The most potent factors in learning to read are intelligence and the degree of tendency to reverse and confuse symbols.

(2) The very bright child is capable of overcoming a strong tendency to reversal and learning to read in spite of it.

(3) Consistent right dominance or left dominance, or ambidexterity with use of the right eye or the left eye are the conditions of lateral dominance most favorable to success in reading.

(4) Ambidexterity with use of either eye, and use of right hand with left eye or vice versa, are less favorable to rapid progress in reading.

Another major theory is that of Dearborn. 11 He asserted that it is easier for the left-handed person to move his left hand from right to left than

from left to right, and easier for the left-eyed person to look from right to
left than from left to right. Deviations then from right-sidedness would be
expected to be accompanied by greater than average tendencies to move the eyes
in the wrong direction in reading. With mixed dominance or a lack of
consistent preference for either side, confusion in the direction of eye move-
ments in reading, and reversals and other types of word-recognition
difficulties would be expected. Orton and Dearborn agreed that consistent left-
sidedness is less of a problem than mixed dominance. Orton's theory stressed
confusion in mental imagery, while Dearborn placed the major responsibility on
confusion in motor activity.

On the other hand, there were investigators who felt that the
dominance theory as an explanation of poor school work had been overworked.
Bames was one of these. He did a study of the importance of the various
dominance anomalies in a group of 100 reading disability cases and a control
group of 100 unselected school children of approximately equal age and time
spent in school. There was no significant difference in the frequency of
anomalies of eyedness and handedness alone, but there was nineteen per cent
more, mixed dominance among the poor readers. The outstanding type of mixed
dominance was that of left eyedness with right handedness in which there was
ten per cent more among the poor readers. These differences are not very great
but they indicate a tendency that merits further investigation and they suggest
that lateral dominance anomalies may be one of the etiological factors in poor
reading.12

Similar conclusions were reached by Ullin Leavell in that the results
of his study of visual imagery of symbols in space and the directional

12 Thomas Harrison Bames, "The Anatomical Basis of Lateral Dominance",
observation of symbols pointed to left-dominance as less favorable to the acquisition of reading skill than right-dominance, and to the conflict between eye and hand dominance as less favorable than complete left-dominance. Leavell found that impartiality of dominance reflects very little upon reading achievement.13

Helen Robinson engaged in research designed to discover whether those pupils with consistent eye-hand preference made slower progress and exhibited more unique problems in learning to read than did the pupils with consistent eye-hand preference. To make this comparison, kindergarten pupils were tested for eye-hand preference and for reversal and directional tendencies, and their subsequent progress was evaluated over a period of approximately two years.

The conclusions reached in Robinson's investigation have definite implications for teachers.

(1) Because bright pupils who prefer their right hand and left eye tend to move from right to left before reading instruction, it is imperative that first-grade teachers place emphasis upon the fact that, to read English, pupils must begin at the left and move to the right. Sufficient practice should be given in using this order or progression to establish a pattern for those pupils who tend to move in the opposite direction.

(2) Her study demonstrated that pupils with inconsistent right preference make no more reversal errors than do those children with consistent right preference and that they make adequate progress in reading if the classroom teacher provides the proper type of instruction. Consequently, classroom teachers of bright children can teach reading to first-grade pupils without

---

The conclusions of Robinson differed from opinions and other pieces of research. Perhaps the fact that the investigation was made with young children in whom laterality is not completely established influenced the findings.

Clinical studies such as those done by Harris support the statements of Orton and other neurologists in showing that confusion in laterality and directionality shows up clearly in many children with reading disability when tests are given. Harris composed a test to determine laterality. His studies show that the development of a fairly consistent preference for one hand takes place later than the age of nine in a far higher proportion of reading disability cases. The significant question pointed up by Harris is whether or not a person shows directional confusion. This of course is shown quite typically in the presence of reversals in reading. It may also appear in spelling and the writing of numbers, in typing, or in speech in the form of stuttering.

When Orton began his research as a neurologist he worked in the field of reading and speech but his contributions were not utilized to the fullest by educators. They attributed a certain bias to Orton's diagnostic measures and the research in this important field lagged. The contribution that neurology was going to make to education was delayed. However, researchers who followed pointed to the work of Orton and joined him in searching for a central and basic approach to solving the problem of language.

\[15\] Harris Tests of Lateral Dominance.

\[16\] Harris, loc. cit.
Only one investigator suggests treatment for poorly organized children. This was Delacato. Even he has not presented controlled studies of disability cases in a re-education environment. His first reported study, however, is worthy of note:

The neuro-psychological concept for the diagnosis of reading problems and neurological organization as the primary treatment modality is based on the premise that language is the distillate of man's phylogenetic neural development, and the normal language function and reading are the distillates of a total ontogenetic neural development. 17

Delacato's study aimed at finding the common characteristics among poor readers, and it was found that there was no significant correlation between the following and poor readers as a group: 1) low intelligence, 2) common socio-economic status, 3) race, 4) religion, 5) divorce in family, 6) very progressive or very conservative schooling, 7) too much or too little phonic instruction, 8) faulty school placement, 9) changing teachers, 10) rigid or lax parents, 11) bi-lingualism, 12) poor hearing or poor vision, 13) poor attitude toward school, 14) lack of interest, motivation or reading materials, 15) severe emotional conflicts, or 16) specific teaching method.

The original studies indicated that groups of poor readers exhibited a lack of neurological organization as their most significant common trait. Approximately seventy per cent of the children seen by his reading clinics had some need of and profited from neurological organization.

This indication of the neurological realm as a potential etiological factor in poor language and reading development caused Delacato and his associates to suggest that after the natural laterality of the child had been determined three things should be done:

(1) Make the dominant hand the most skilled and the most used hand by

(2) Establish the eye on the side of dominance as the controlling eye in binocular vision. This can be done through occlusion and re-training. This should begin at far-point and then be followed at near-point.

(3) Re-educate the child so that proper foot is dominant.

Having ascertained the areas of neurological organization which are lacking, pre-remedial programs aimed at establishing neurological organization are initiated. Reading activities are discontinued during this pre-remedial period. This usually lasts about six to eighteen weeks, during which time re-evaluations are made. When neurological organization is achieved the child is returned to his remedial or educational situation.18

Delacato relates language performance to such functions as birth and early development, sleep patterns, creeping abilities, bi-ocular and binocular skill, handedness and footedness and perceptual patterns. He studied under Temple Fay with the work of Gesell and Orton as underlying research. In working under Fay, a neurosurgeon, we may see merging the disciplines of neurology and education which many of the early researchers neglected to do. Delacato's search for answers to the prevention of language problems more intelligently, to the prediction of them more reliably, and to the diagnosing of them more validly, centers upon the development of the child in a neurological and wholistic approach. We look for experimentation to support the theories which appear so logical to those who work with children.

CHAPTER IV

PROCEDURE OF THE STUDY

It has been pointed out over and over again that many disabled readers are ill-lateralized, exhibiting inconsistencies of preference between hand, foot and eye. Opinion differs as to the incidence and significance of such anomalies, and some investigations have denied that there is a relationship between neurological organization and reading. It is obvious from research and from experience that not all disabled readers are poorly organized neurologically, and that many individuals with odd or inconsistent lateral preferences learn to read normally and some to their capacity.

The purpose of this study is to point out the incidence of poorly organized children in a reading disability group, and to inquire whether the reading disability of poorly organized children differs in any significant way from the type of reading disability of well organized children.

Plan of the Study

There are 217 Parochial Schools in the City of Chicago participating in the Archdiocesan Reading Program. Approximately thirty-one percent of the total fifth grade population, (11,341 students), judged on the basis of standardized testing and performance are below grade level in reading achievement.
From this reading disability population, (about 3,516 children), a sampling of 203 children in six representative schools was selected for this study.

The schools included in the sampling are staffed by five teaching communities, whose methods and organization of reading instruction have been directed, supervised, and evaluated by the Archdiocesan Reading Consultant assigned to these schools. This type of control with continuing in-service training in the form of demonstration lessons, personal interviews of teachers, and other guidance procedures, has been in effect in these schools for an average period of five years. On this basis it may be assumed that an organized and relatively uniform reading program has been followed by the school personnel involved.

Range in size of student population in the selected schools is from 420 to 2100 pupils. Yearly student transfer rates, not exceeding two percent seem to indicate a stable population. Selection of sampling units were:

From Schools I and II, located in Census Tract 0505, thirty-eight boys, thirty girls, with a mean I.Q. of 99.

From Schools III and IV, located in Census Tract 0808, thirty-five boys, thirty-two girls, with a mean I.Q. of 101.

From Schools V and VI, located in Census Tract 0915, thirty-six boys, thirty-two girls, with a mean I.Q. of 108.

All of the children chosen, fifty-three percent of whom are boys, forty-seven percent of whom are girls, with a mean I.Q. of 102, form the corrective reading groups in their respective schools. Table I describes the composition of the sampling in relation to the reading disability population and the total fifth grade population.
Three broad socio-economic classes appeared to be represented by the 203 children selected for this study. The sixty-eight children attending Schools I and II seemed to be representative of a "low socio-economic" level. A "middle socio-economic" designation seemed to apply to the sixty-seven children from Schools III and IV. The sixty-eight children from Schools V and VI appeared to be "high socio-economic."

Socio-economic levels are delineated for the purposes of this study on the basis of the application of "The Index of Social Characteristics," (I.S.C.) developed by William Lloyd Warner and associates in their
stratificational study of "Jonesville,"\textsuperscript{1} to information tabulated in the 1960 U.S. Census Report for Chicago and environs.\textsuperscript{2}

Table II shows I.S.C. information drawn from the Census Report and indicates the relationship of the schools in the sampling to City-wide median figures.

Briefly, the Index of Social Characteristics is a four point scale based on 1) occupation of head of household, 2) residential area, 3) amount of income, 4) highest level of education attained. This scale applied to information obtained from the 1960 census indicates that there are apparent differences in regard to these four factors.

For the purposes of this study, when a census tract possessed median figures approximating the city-wide medians, the tract was considered to be "middle socio-economic." When a census tract showed medians below, it was considered to be "low socio-economic." When the median figures were above, the census tract was termed "high socio-economic."

A census tract is a small area into which large cities have been divided for statistical purposes. Tract boundaries were established cooperatively by a local committee and the Bureau of the Census, and were generally designed to be relatively uniform with respect to population characteristics, economic status, and living conditions. The average tract has about 4,000 residents. Tract boundaries are established with the intention of being maintained over a long time so that comparisons may be made from census to census.\textsuperscript{3}

Table II shows that Census Tract 0505, in which Schools I and II are

\textsuperscript{3}Ibid., p. 1.

</tbody>
</table>
located is below the city-wide averages in every respect. The thirty-eight boys and thirty girls attending these schools come from a residential area in which the houses or apartments are in generally poor condition, of low monetary value, small and overcrowded. Their parents' median income is approximately 2,000 dollars below that of the median income given for the city. Typically, the occupation of the father is unskilled. More than half the total of those employed are categorized as laborers, service and household workers. The rate of unemployment in this area is almost three times that of the city-wide rate. In regard to education, most of the parents do not possess more than eight years of schooling, nearly two years below the city median. These children form the low socio-economic group.

Table II also indicates that median figures for Census Tract 0808 containing Schools III and IV, approximate those of the city-wide medians. The thirty-five boys and thirty-two girls live in neighborhoods containing two family dwellings or single family houses of moderate size. Very few of the homes are in poor condition or overcrowded. Parents of these children are predominately skilled workers, technicians, or involved in some form of clerical or sales work. The unemployment rate is 1.5 percent under the median for the city. Most of the parents have attended high school or possess a high school education. Their median level of education is only two tenths above that of the city-wide figure. Median income is 301 dollars above the median given for the City of Chicago. The children attending these schools constitute the middle socio-economic group.

Census Tract 0915 (Schools V and VI), described in Table II appears well above the City-wide averages in every area. The thirty-six boys and thirty-two girls included in the sampling from these schools are considered to be the high or upper socio-economic group. They live in residential areas
where overcrowding is negligible, homes are large and of high value. The median income of the parents is more than twice that of the city-wide figure. Almost half of the fathers are engaged in occupations of a managerial-professional nature and the unemployment rate is very low. One or both parents have attended or graduated from college; in some cases possessing a degree beyond the college diploma.

These 203 students from six schools not only represent three broad socio-economic classes as seen by the application of the I.S.C. scale to data from the 1960 census; but these children also represent the fifth grade reading disability population in terms of percentage of boys and girls, mean I.Q. and reading retardation.

Subjects of the Study

These children were included in the study:

1) Children who have average or above average intelligence (a few students were classed as below average) and who exhibit difficulty with some or many phases of reading. These children combine an average or high capacity level with a low achievement level.

2) Children whose reading level is below grade expectancy as determined by intelligence scores on the Lorge-Thorndike Non-Verbal Scale. The children in the study had been placed on the instructional level below fifth level on the basis of standardized tests and teacher opinion in collaboration with the reading consultant who serves the schools.

The following types of children were not included in the study:

1) Mentally retarded children or very slow-learning children who are already reading to grade capacity.

2) Children for whom the English language is a barrier.
The Tests Administered

All children in the study were given the following tests during the month of November:

1) Lorge-Thorndike Intelligence Test; Non-Verbal Battery
2) Silent Reading Diagnostic Test
3) Iowa Test of Basic Skills
4) Informal Reading Inventory
5) Doman-Delacato Scale for Neurological Organization

After the testing the children were divided into two groups:

1) Fifth grade children reading below grade expectancy level with average or above average intelligence scores who are well organized neurologically. This formed group A.

2) Fifth grade children reading below grade expectancy level with average or above average intelligence scores who are poorly organized neurologically. This formed group B.

Description of the Tests

Lorge-Thorndike Intelligence Test: Non-Verbal Battery: The Lorge-Thorndike Intelligence Test is a group test which is easy to administer. The Non-Verbal Battery was selected because it uses items which are either pictorial or numerical. For the average pupil, such tests do not predict school achievement quite as well as scores from a verbal type test. However, they do give an estimate of scholastic aptitude which has not been influenced by any lack of ability to read. Level three, for grades four to six, was given.

Four types of norms have been developed for the Lorge-Thorndike Test; (1) intelligence quotient equivalent, (2) grade percentile, (3) grade equivalent, and (4) age equivalent.
The intelligence-measuring scales utilize materials that are both verbal and non-verbal in character. Although the authors are not concerned with presenting or insisting upon a formal definition of intelligence, they do state that the following mental processes are descriptive of intelligent behavior and are sampled by their tests: (1) dealing with abstract and general concepts; (2) interpretation and use of symbols; (3) dealing with relationships among concepts and symbols; (4) flexibility in the organization of concepts and symbols; (5) utilizing one's experiences in new patterns; and, (6) utilizing "power" rather than speed in working with abstract materials.

The time for administering this test was about one hour.

Silent Reading Diagnostic Test: The Silent Reading Diagnostic Test is one of the Developmental Tests of Bond, Clymer, and Hoyt. It is particularly designed to give the classroom teacher help in diagnosing the reading needs of her pupils. This test was selected for the high level of its diagnostic value.

The Silent Reading Diagnostic Test is composed of eleven sub-tests which evaluate the areas of word-recognition, comprehension, vocabulary and phonics. Scores were obtained for each of the sub-tests and they were divided into three areas for analysis: (1) Comprehension, (2) word recognition (excluding phonics), and (3) phonics.

The sub-tests were then further analyzed in these areas: (1) comprehension: in isolation and in context; (2) word recognition: visual and auditory; and (3) phonics: analysis and synthesis.

The time for administering this test was about two hours.

Iowa Test of Basic Skills: The Iowa Test of Basic Skills was devised to test fundamental skills in the areas of vocabulary, reading, the mechanics of correct writing, methods of study, and arithmetic. The primary purpose of the tests is to reveal how well each pupil has mastered the basic skills. The test
was selected because it was a valid instrument for measuring the skills of reading and the closely allied skills of correct writing, methods of study and the added skill of arithmetic.

The test battery consists of eleven separate tests, arranged according to grade level. The battery yields grade-equivalent scores on the eleven tests which are suited for measuring growth from year to year.

The reliability coefficients range from .84 to .86 for the major tests and from .70 to .93 for the subtests. The composite reliabilities for the whole test range from .97 to .98 for the different grades. These correlations are sufficiently high for individual diagnosis and prediction.4

Two types of norms are provided: grade norms and percentile norms within grade. One valuable aspect of the norms is their development for beginning-of-year, middle-of-year and end-of-year performance.

The vocabulary tests concentrate attention on understanding the meaning of words. This battery purports to test "basic skills" and not meaning or content aspects of the child's development.

The test of reading comprehension evaluates the specific comprehension skills involved in analyzing, organizing and evaluating a reading selection. Many of the items dealing with detail questions go beyond recognition of facts to understanding and drawing inferences from the reading selections.

The language skills tests cover the four areas of spelling, capitalization, punctuation and usage.

The section on work-study skills contains tests to evaluate the child's ability to use graphic material, reference materials, tables and maps.

The arithmetic section is devised to assess the knowledge of fundamental

relationships and experiences in number which form the basis of the modern approach to arithmetic. Computation is encountered in meaningful form in the problems subtest.

Informal Reading Inventory: The Betts Informal Reading Inventory was given to each child individually to determine his instructional level and also to receive an evaluation of his oral reading skill. When he read with at least seventy per cent comprehension and without missing more than one word in twenty running words he was considered able to read on that particular level.

Doman-Delacato Scale for Neurological Organization: The Doman-Delacato Scale for Neurological Organization was used by the writer to test each child individually. The tests were divided into two sections: the laterality tests and those pertaining more directly to neurological development.

Laterality: The individual who consistently preferred the right eye, hand and foot in the series of laterality tests, was classified as one having right dominance. If the left eye, hand and foot were preferred, he was classified as having left dominance. This indicated that either the left or right cortical hemisphere of the brain was dominant. However, if the individual indicated by tests that he preferred the left eye and consistently showed right handedness, he was classified as having mixed dominance. This indicated confusion as to which cortical hemisphere was dominant. This in turn indicates that the individual lacked neurological organization and the adequate development of some or all of the lower neurological stages.

Tests to determine eye preference used in this study include the following:

(1) To determine eye preference at far point two instruments were used, a telescope and a board or heavy cardboard. The subject was
asked to sight some distant object through the telescope (cylindrical cardboard tube) held in both hands with both eyes and then to cover one eye and see if the object could still be sighted. The eye which continued to see the object through the telescope while the opposite eye was occluded was recorded as the sighting eye. This is binocular sighting at far point.

(2) An object was sighted with both eyes through a cardboard which had a hole in the center. The cardboard was held at arms' length. The subject was asked to bring the cardboard back to the one eye keeping the object in view. The eye to which the child brought the hole was recorded as the dominant eye. This is monocular sighting at far-point.

(3) For near point sighting the child was handed a cylindrical tube and told to look through it, placing it near his eyes. The eye to which he brought the tube was recorded as the dominant eye at near point.

(4) Also at near point: A small x was placed on a sheet of paper. The child sat at a table with the paper at reading distance. He was handed a three inch tube in both hands and asked to sight the x. The eye to which the tube was brought was recorded as the near-point sighting eye.

(5) The controlling eye was determined by having the child follow a point on an object (top of pencil, for example) in a circular or vertical movement. The movement of the eye was observed and the controlling eye noted.

Handedness was tested in the following manner: Each child was asked to do several things; to show how he would brush his teeth, to cut
with a scissors, to write his name, to throw a ball, and to pretend he was eating. He was asked to do these things several times and the hand used in each of the actions was noted. If the child consistently used his right hand, he was classified as right-handed; if he consistently used his left hand, as left-handed; if he used his right hand for some actions and his left hand for others; this was noted and he was classified as mixed handed.

Footedness was determined by having the child kick with a football, step on a chair, and take a step forward.

General Neurological Organization

Other tests that were administered to determine the degree of general neurological development were:

(1) Creeping: There are varying degrees of perfection in creeping. The lowest is homologous type of moving, i.e., moving both hands forward first, followed by a moving forward of both legs. The next stage of refinement is a homolateral pattern of moving forward of the same hand and leg simultaneously. Finally, the perfect pattern is one in which the opposite hand and leg move forward simultaneously. This is called cross-pattern. The scale was scored good if cross-pattern creeping was done, fair if homolateral creeping was done, and poor if homologous creeping was done.

(2) Cortical opposition was measured by opposing the thumb and forefinger and then repeating the action rapidly. The ability to do this act rapidly more than once is a brain function, controlled by the cerebella. Although mammals do develop neurologically the same as man, this function is peculiar to man.
(3) Supination and pronation is measured by extending the lower arms with palms up and turning the palm down; then reverse the procedure. This should be done rapidly. This too, is an act only man can execute.

Results of the Tests

Doman-Delacato Scale: The results of the testing using the Doman-Delacato Scale divided the fifth grade reading disability cases into two groups; Group A, those who were well organized; and Group B, those who were poorly organized. Table III shows the incidence of well-organized and of poorly organized fifth grade children in the three socio-economic groups.

The highest percentage of poorly organized children was found in the low socio-economic areas, and the highest percentage of well-organized children in the high socio-economic areas. In the total fifth grade population that was tested sixty-nine per cent of the group was found to be poorly organized and thirty-one per cent was measured to be well-organized. The specific type of neurological disorganization will be discussed in Chapter V.

Lorge-Thorndike Intelligence Test: Non-Verbal Battery: Standard test results were obtained from this test. Table IV presents the frequency distribution of the intelligence quotients for the fifth grade children and shows the distribution in both Group A and Group B. With a mean intelligence quotient of 108, Group A, (well-organized), was superior in intelligence as measured by this test. Group B, poorly organized, had a mean IQ of ninety-nine. Both groups

approximate the measure of average intelligence. The range of both groups had the same upper limits, 129, while the lower limit of Group A was eighty-two and the lower limit of Group B was seventy-two. The standard deviation was computed for both groups, showing a sigma of 27.14 for Group A and a sigma of 34.35 for Group B. A z score was computed to be 1.97 showing the difference between the groups to be significant at the .05 level. Table V shows the means and other statistics in the comparison of both groups on the intelligence test.

Every one of the children tested was on an instructional level lower than the grade expectancy score on this test would anticipate.

Reading Status of the Children:

**Iowa Test of Basic Skills:** Table VIII is a record of the mean scores of each group for vocabulary, comprehension and arithmetic. The arithmetic scores were included as another measure to see if there were any significant differences in the way the two groups performed in this subject. When considering the scores of children in the two groups and after applying the formula for measuring the z score, no significant difference was found between the well-organized group and the poorly-organized group. Table IX shows these statistics.

Silent Reading Diagnostic Test: The Silent Reading Diagnostic Test was administered to the same groups of children as another check on reading efficiency. Table X shows the mean scores for comprehension, recognition, skills and phonics. Without exception, the mean scores for phonics was the lowest of the three. Scores in recognition were next, and the highest scores were obtained in comprehension skills. The results of the Silent Reading Diagnostic Test closely resembled the results of the Iowa Test of Basic Skills.

Table XII shows the statistics in the comparison of Group A and Group B on the Silent Reading Diagnostic Sub-Tests. Means were computed for both groups in comprehension in isolation and in context; in both visual and auditory recognition and in phonetic analysis and synthesis. The standard error of the mean and the z score were computed and showed a significant difference in three areas. In each case Group A scored higher. The highest z score was found in visual recognition scores of Group A. The mean score was 5.2 with a standard deviation of 3.50 while the mean of Group B was 4.3 with a standard deviation of 3.07. The standard error of the mean was .422 and the z score of 2.13 was significant at the .05 level.

Group A also scored higher in comprehension in context showing a mean of 5.5 with a standard deviation of 1.94 while Group B had a mean of 4.6 with a standard deviation of 4.23 showing a standard deviation to be .434 with a z score of 2.07. This was significant at the .05 level.

Finally, Group A scored significantly higher in auditory recognition with a mean score of 5.1 and a standard deviation of 2.58 while Group B had a mean score of 4.2 with a standard deviation of 2.77. The z score of 2.01 was significant at the .05 level.

There was no significant difference between the groups in phonetic analysis and synthesis. The mean of Group A was 4.4 and the mean of Group B was 4.3 in analysis; the mean of Group A was 4.2 and the mean of Group B was 4.5 in synthesis.

Informal Reading Inventory: This tool provided a measure of the child's oral reading and at the same time placed him on an instructional reading level. Each child's instructional reading level was noted as below his grade expectancy, and the oral reading of Group A was more generally superior to the oral reading of Group B. The children's oral reading was taped and rated only
The range of reading level as measured by the Informal Inventory was from level one through level four. The largest number of children read on level four; only two children read as low as level one.

Summary

Two hundred three children in fifth grade reading disability groups from three socio-economic areas of Chicago were tested on the basis of intelligence, achievement and neurological organization.

Significant findings are: (1) high incidence of neurological disorganization, (2) reading disability of neurologically disorganized children does differ from the reading disability in organized children. Neurologically disorganized children scored significantly lower in (a) comprehension in context, (b) visual and auditory recognition, and, (c) oral reading performance.
CHAPTER V

ANALYSIS OF THE TEST RESULTS

The large number of conferences, seminars, and publications regarding the disabled reader indicate not so much the volume of new information available but the intensity of the search for new information. Consultants, administrators, teachers and parents are looking to theory and practice for answers to the haunting question of why some children are not reaching their potential in reading efficiency.

An analysis of the results of the tests used in this investigation may partially answer the query, or may answer it for at least one group of disabled readers.

Many investigators have pointed out the observations of mixed dominance of disabled readers and even looked to this as an etiological factor in the disability. Studies done with young children would appear to be inadequate in this regard because laterality is not established until after six or seven years of age in some children. Because of the varieties of type, investigation results differ slightly. Because of the multiple causes for reading disability and the influence of the psychological, environmental and physical factors that are operative, investigators have hesitated ascribing poor neurological development, or at least mixed dominance, as a cause of reading disability. Orton and Dearborn have agreed that consistent left-sidedness is less of a
problem than mixed dominance, and that left-eye dominance is more important, as far as reading is concerned, than left-hand dominance. But whether the incidence of mixed dominance is large enough to consider significant and how this anomaly should be treated was usually not a part of these earlier studies.

Incidence of Neurological Disorganization

The 203 fifth grade children were reading below grade expectancy as measured by the Lorge-Thorndike Intelligence Test. Reading level was measured by the Iowa Test of Basic Skills and the Informal Reading Inventory. Each child was given a test for general neurological organization which included the Doman-Delacato tests for laterality. This test did two things: (1) pointed out the incidence of poorly organized children in the fifth grade disability groups, and, (2) showed the type of neurological disorder.

This study showed that in the total group 140 children, or sixty-nine per cent of the group, were poorly organized. An interesting trend was noted in the incidence of poorly organized children from the three socio-economic areas. In the high area, sixty-five per cent of the group was poorly organized, seventy per cent in the middle class area and seventy-three per cent in the poor or low socio-economic area. Fewer children (only twenty-seven per cent) of this last group were well organized. This may be due to the fact that these children come from smaller homes, usually live in crowded conditions and perhaps lacked the opportunity for mobility, an important factor in developing neurologically. We may point to the children in the highest socio-economic area as those having less difficulty with organization and this may be due to the fact that they have the space needed for this development. It may be that for children in culturally deprived areas, where space is often at a premium, the opportunity to refine the skills of motor development is missing.
On the other hand, the large percentage in the high economic area, only eight points less than in the low socio-economic areas is a surprising finding. Here, in suburban areas, where one assumes children given the opportunity to have large spaces in which to play, and living in homes where freedom is easily given, we may expect a smaller incidence of poorly developed children. Perhaps this study may look to schools to set up some program for all children which would offer opportunity for this type of development.

Type of Neurological Disorder: When the tests for laterality and general neurological organization had been given, a high proportion of mixed hand dominance was found. This would support the findings of Harris, Orton, and Dearborn. The anomaly presenting the largest incidence was that of children who were dominantly left-eyed and right-handed. Only one child was left-eyed, left-handed and right-footed and only one child had the reverse pattern.

Table XIII shows the incidence of the type of neurological disorder in each of the three socio-economic groups and in the total group. The table shows an overlap in number because of course many of the children who were mixed-eyed at the same time possibly had poor patterns of creeping. It will be noted that 137 of the 140 children had some type of laterality disorganization. It may be well to list here the different types of lateral dominance. Fifty children were consistently left-eyed and right-handed; ten children were right-eyed and left-handed; one child was left-eyed, right-handed, and right-footed; fifty-two children were mixed-eyed. Sometimes they preferred the right and sometimes they preferred the left eye, for sighting at near or at far point. With some children the telescope was brought between the eyes rather than to either one. Ten children were ambidextrous, performing some actions well and easily with the right hand and other actions with the left hand or all actions with either hand. Thirteen children had not established handedness, eyedness nor footed-

ness. Three children in the group of 140 children had established laterality on the dominant right side. Their neurological disorganization was accounted for in one of the other categories. Sixty-four children were unable to effect good cortical opposition; sixty-three crept in a poor pattern and supination and pronation in forty-two children was inadequately done. This variety in type or pattern of neurological disorder complicates the picture further. It is not possible to isolate one of the anomalies and prevent further disability through treating this as a cause.

Anecdotal notes concerning some of the children: It may be interesting to point out in case-study fashion interesting information regarding some of the individual children included in the population. This may give the reader an idea of combination of reading disability and type of neurological disorder. The following children come from the high socio-economic group and they are children for whom a program of re-organization will be set up. This program is not a subject of this study but it is a program toward which the study points. This program has for its main feature the occlusion of the child's sub-dominant eye by means of a red filter over the lens of the glass and a green filter over the printed matter in the text or workbook. This prevents the child from seeing anything with this sub-dominant eye while continuing the use of the muscles of the eye. This is an attempt to align the dominant eye with the dominant hand. A second part of the program includes periods of creeping in cross-pattern movement. Here the child is functioning with both sides of his body in concert. Creeping, which is a function of mid-brain, is done to increase efficiency in movement, and the ability to integrate many formerly separated receptive and expressive functions.

Student No. 1: Paul's IQ of 115 denotes a grade expectancy of 8.2. At present he is reading on level four and scores on reading tests range
from a low of 3.9 in phonics to a high of 5.5 in vocabulary. He is left-eyed and right-handed and right-footed.

**Student No. 2:** Jean had an IQ of 107 with a grade expectancy on the Lorge-Thorndike of 5.7. She is presently scoring about one year below this and her instructional level is fourth grade. She shows greatest weakness in vocabulary technique as measured by the Iowa Test. She is mixed-eyed, bringing the cardboard with the hole in the center between her eyes. She is right-handed in all actions and left-footed in kicking and walking upstairs.

**Student No. 3:** Michael's tests report an IQ of 110, with a grade expectancy of 7.2. He is being instructed on level four and his scores on the Iowa and the Silent Reading Tests support this. When tested on the Informal Inventory he hesitated, read quite jerkily, and backtracked in many of the words. He is right-eyed and right-footed and consistently left-handed.

**Student No. 4:** An IQ of ninety-six reports a grade expectancy of 5.5 for John who is reading on level four. Scores on the Iowa and the Silent Reading Tests range from 4.0 to 6.0 with the highest scores being gained in recognition skills. His oral reading was very poor from the standpoint of fluency. He is mixed-eyed, sighting with the left-eye at near-point and with the right eye at far point. He is left-handed and right-footed.

**Student No. 5:** Cynthia's IQ of 116 yields a grade expectancy of 7.5, higher than the Iowa shows in performance. The scores on the reading tests show fifth level work and the informal inventory finds this child able to read well on level four. She is left-eyed, right-handed and left-footed. Her creeping pattern is very
poorly done.

The case studies have one similiar thread running through them: children reading below their grade expectancy with a particular pattern of reading defect, disclosed by analysis of the subtests of the tests administered; significantly lower scores in (a) comprehension in context; (b) visual and auditory recognition; and (c) oral reading performance. Each of the children is poorly organized from the viewpoint of laterality. That this may be an etiological factor of the reading disability cannot be overlooked.

Consideration of Intelligence Quotients and Grade Expectancy Scores

In examining the results of the Lorge-Thorndike Intelligence Test: the Non-Verbal Battery, it was found that the range of intelligence quotients was a large one - from 129 to 74. The mean IQ of the total group was 101, an IQ falling within the average range of ability. The mean IQ of the well organized children was slightly higher, 108. The mean IQ of the poorly organized group was 99. The mean IQ of the middle class, poorly organized children was the lowest found in the group; it was 97. Tables XIV and XV point out the mean scores on the Lorge-Thorndike Scales, for both groups. The score of 1.97 showed the groups to be significantly different at the .05 level.

We cannot infer from this that poorly organized children are less intelligent nor do we even mean to imply this to the reader. On the other hand we would mention that it will be possible to treat the groups as fairly well matched on the basis of the intelligence scores obtained in the Lorge-Thorndike Test.

The cluster of scores in both groups fell between 95-104 which may point to weaknesses in the instructional program for these children. We are not in a position to determine if the large number of children in this group:

(fifty-seven out of the 140 in Group B, and nineteen of the sixty-three of Group A) or thirty per cent of the total group is there because we are not providing for these children in the kind of teaching we are doing, or whether we might do well to give attention to neurological development and then consider the instructional program.

Consideration of the grade-expectancy scores of the fifth graders shows the well-organized group in all three socio-economic areas with higher mean scores. See Table XV. The highest mean score was found in the highest socio-economic area of the well-organized group. An analysis of the data summary sheets for each child (Appendix VI) showed that there was a one-to-one relationship between grade expectancy and instructional level of the child at the time of testing. Everyone of the children included in the study was performing below the grade expectancy score on the Lorge-Thorndike. Here was a population of children who, receiving adequate instruction, had the use of proper materials and for some reason were not meeting their potential. It would appear that a careful study of the neurological pattern of these children would be helpful and would give insight to their problem. Unfortunately, most of the variables we study in education and psychology are highly complex and instead of having a single cause may have many contributing causes.

Reading Status of the Population

The Betts Informal Reading Inventory is an adequate measure of a child's instructional reading level if the test is properly administered. The proper rapport was established and each child was given this inventory individually. This was an opportunity to obtain an evaluation of the oral reading habits of the children as well. More children in the well-organized group were reading at level four, only one year below the instructional level of the grade. Some
of these children, however, showed wide discrepancies between their instructional level and their grade expectancy. However, when combining level four and level three-two and looking at the number of children in both groups we find eighty per cent of the population at these levels. Here again the groups are similar and the contrast in neurological development sharpens as we see them alike in so many other ways.

In listening to the oral reading of the children as they read selections from the Betts Informal Reading Inventory, it was noted by the investigator that the oral reading habits of Group A were better than the oral reading habits of Group B. Errors in oral reading skill were noted in such points as repeating words already read correctly, lack of expression which was also manifested in their oral speech, and a lack of fluency in general. These errors were not as prevalent in Group A. Tables XVI and XVII present the findings of the Betts Informal Reading Inventory.

The Iowa Test of Basic Skills gave an index of the reading performance of both groups on the basis of vocabulary and comprehension. The groups did not differ from one another as noted in Table XI in Chapter IV. The mean scores were quite similar. The score of Group A was the higher in the high and middle socio-economic areas and was slightly lower in the low economic areas. This test then showed no significant differences between the groups. The second hypothesis of this study - that the reading pattern of the two groups would differ - would have to be rejected if no further analysis of this test had been made.

Silent Reading Diagnostic Test was administered as an added measure of the reading ability of the children. Here, too, the results were similar to those of the Iowa Test of Basic Skills and showed mean scores almost identical with those obtained on the first test.

But a significant finding is noted when an analysis of the sub-tests is made. When dividing the comprehension scores into comprehension in isolation and comprehension in context we find the well-organized group with a higher mean score in the latter and the poorly-organized group scoring higher in comprehension in isolation. The z score of 2.07 showed significance at the .05 level when comparing the groups in comprehension in context scores. A z score of 1.40 for the groups in comprehension in isolation was approaching significance.

The mean scores in both visual and auditory recognition tests for the poorly organized group was lower than for the well organized group. Z scores of 2.13 and 2.01 showed significance at the .05 level in both instances. This would point to less efficiency of neurologically disorganized children in two important areas of word recognition: visual and auditory competence.

The purpose for examining sub-tests in phonics scores was to determine if there were any significant difference between the method in which these children attack words phonetically. Mean scores, quite similar, showed no significant differences when well or poorly organized children attacked words analytically or synthetically.

The informal reading inventory also showed weakness in neurologically disorganized children in fluency in oral reading.

The idea of qualitative differences in the reading disability pattern in children who are neurologically organized and those who are neurologically disorganized would appear to be an important finding. This indicates a need for detailed and refined analysis when examining the results of tests of these children in order to plan a program for them.

On the basis of the analysis of the sub-tests the second hypothesis of this paper may be supported.
When the data from the present study are compared with the findings of other studies of reading disability and laterality, quite general agreement is found in the incidence of neurologically disorganized children in the population. There would be further reason then in pointing to the realm of neurological organization as an etiological factor at least in case of some disabled readers. Future investigations will need to clarify through experimentation the process of re-organization mentioned earlier in this study.
CHAPTER VI

SUMMARY AND CONCLUSIONS

Restatement of the Problem and Procedure

The present study had two purposes: (1) to ascertain the incidence of neurological disorganization present in fifth grade children reading below grade level; and (2) to compare the patterns of reading disability of children who are neurologically disorganized with those who are neurologically well organized.

Because of the interest of the writer in children with reading disability it was hoped that the investigation would bring further light to the relation of neurological organization to reading disability, point out the incidence of neurologically disorganized children, provide further insights into the types of reading handicap, and give direction to consultants and teachers in how to adjust instruction for children who are neurologically disorganized.

The following tests were administered to each of the 203 fifth grade children in the three differing socio-economic areas:

(1) The Lorge Thorndike Intelligence Test: Non-Verbal Battery
(2) The Iowa Test of Basic Skills
(3) The Silent Reading Diagnostic Test
After the tests had been administered, and scored, the following results may be noted:

(1) The range of IQ scores on the Lorge-Thorndike Intelligence Test was 74-129. The mean IQ of the total group was 101; the mean IQ of the group of neurologically well-organized children was 108, slightly higher than the mean IQ of the poorly organized group, that of 99. The children in both groups fell within the average or above average range; only a few children scored below 90. The groups were significantly different at the .05 level.

(2) The Lorge-Thorndike also gives a grade expectancy score which again provided a wide range in both groups. Well-organized children ranged from 11.4 to 3.0 in grade expectancy; the poorly organized group ranged from 11.4 to 2.0. On the basis of the Lorge Thorndike Test both groups were well matched. There was no significant difference between the groups.

(3) The Doman-Delacato scale divided the children into two groups: Group A those who were well organized neurologically and Group B those who were poorly organized. The number in Group A was sixty-three or thirty-one per cent, while the number in Group B was much larger, 140, or sixty-nine per cent. The variations of poor organization have been discussed in chapter four.

When the children were divided on the basis of socio-economic areas, it was found that thirty-five per cent of upper group was well-organized and sixty-five per cent of this group was poorly organized. The proportion changed in the middle class area with thirty per cent of the group well organized and seventy per cent poorly organized. The smallest number of well organized children was found in the lowest socio-economic area; twenty-seven per cent well organized and seventy-three per cent of the children poorly organized.
This was a significant incidence of poorly organized children to look to neurological organization and its relation to reading disability in terms of treatment.

The writer was unable to find any studies of reading disability and lack of neurological organization differentiating the various socio-economic levels. The results of this investigation, however, support the studies of Orton, Monroe and Harris who found incidence of mixed dominance in children with reading disability.

(4) The results of the Iowa Test of Basic Skills show that most of the children scored between 4.9 and 5.1 on the various tests. The mean scores did not differ significantly for the two groups. There was a positive relation between the results of the Iowa Test and the results of the Silent Reading Diagnostic Test. Through the analysis of the diagnostic sub-tests poorly organized children scored significantly lower than organized children in comprehension in context, and in both visual and auditory comprehension. Their oral reading as measured by the informal reading inventory was less well done.

This data may prove to be of significance in supporting the second hypothesis of this investigation.

Conclusions

Subtle and complex interaction among several variables may greatly increase the probability of a child having reading difficulties, but it does not insure that he will have such difficulties. When the conclusions of this study are pointed out it will be not only to point out that neurological disorganization is a factor to be investigated, but possibly a cause of reading disability.

The following conclusions may be made within the limitations of this
The incidence of lack of neurological organization among disabled readers is high enough to warrant a consideration of lateral dominance anomalies as a type of etiological factor in reading disability.

From the results of this study it would appear that there is more than a chance relationship between lateral dominance and general neurological development and reading disability.

This is supported by the fact that neurological disorganization, as measured in this study, presents the same incidence irregardless of social class. One might expect the factor of neurological disorganization to occur in much greater frequency in lower socio-economic areas simply because their reading retardation is greater. But in this investigation this is not the case.

The reading pattern of children who are poorly organized does differ from the reading pattern of children who are well organized when sub-tests are analyzed.

The high incidence of left-eyed, right-handed cases may point to a significant pattern in neurological disorganization.

Implications of the Findings for Teachers

Educators know that neurological disorganization occurs. They know it occurs in high incidence irregardless of factors such as social class and IQ. We can determine who is and who is not neurologically disorganized. It seems beyond the scope of comprehension that no action is taken. The implication for teachers, then, is action.

In an intensive and structured program for children identified as neurologically disorganized, teachers of four, five and six year olds should
Initiate programs to help establish sidedness. Such programs would include the following:

1) Practice the sleep pattern for both the right and the left-handed child.

2) Practice the cross-pattern creeping for ten-minute periods two or three times a day.

3) Practice cross pattern walking for the same length of time (see Illustration I).

4) Play games that will coordinate large muscles. Such games are suggested in *Success Through Play* by Newell Kephart.

Inform the parents of these children of the purpose of neurological training for their children. They could supplement the program of the school by having their children do similar activities at home.

As children move into second grade, teachers may give them tests of laterality described in Chapter IV. These tests would show if the child had mixed dominance or not. Children who have mixed dominance may be urged to continue walking and creeping exercises. Older children may occlude the sub-dominant eye to strengthen the performance of the dominant eye. The occlusion is done by placing a red filter over the lens of the sub-dominant eye and a green filter over the printed matter. Such practice can be suggested for two or three short periods daily.

Exercises that pertain to areas of weakness in the neurologically disorganized child are: exercises to strengthen visual recognition;

1) Visual discrimination: display a variety of pictures in duplicate form, but on separate cards. These may be pictures of fruits, vegetables, pastries, toys, animals, and other things cut from magazines and advertisements. Have the pupils find the pictures that match, or are alike, and place
Cross-pattern creeping

Note that as the right hand is moved forward the left leg moves forward. As this takes place, the head and neck turn slightly toward the forward hand.

Points to be observed in this activity:
Hands are to be flat on the floor and pointed forward.
The hand and knee should move forward simultaneously.

Cross-pattern walking

The right hand and left leg move forward with the head and neck turned slightly toward the forward hand.
The ideal sleep position of the completely left-sided child.

The ideal sleep position of the completely right-sided child.

The child is not expected to remain in this position during sleep, since it is natural for him to shift from one position to another. A child not yet six years old is not expected to maintain a preferable position for a particular side for an extended period.
them as a pair in the card holder or along the chalk ledge.

2) Use the same pictures suggested above. Give one of each kind to each child in the group. Display the others in the card holder. Have each child show his picture to the group, then find the one that matches his picture in the card holder.

3) Meaning of left and right and directional orientation. Have the words left and right printed on word cards. Present one card at a time, and ask pupils to show that particular hand, foot, arm, or any other part of the body.

4) Visual recognition of letters of the alphabet.

5) Tracing forms and letters or directional sequence of pictures.

Exercises to strengthen auditory recognition:

1) Auditory perception of rhyming words: let children choose a phonic picture card, tell what it is and name a word that rhymes with it.

2) Auditory perception of beginning sounds in words: refer children to pictures and ask them to find and name things in the picture whose names begin with a given sound.

3) Auditory recognition of rhymes.

Exercises to develop comprehension on context:

1) Recall nursery tales and retell a story.

2) Identify pictures of objects that belong together.

3) Present vocabulary so that the child assumes an active part in order that he sees the meaning of the word in relation to the rest of the sentence and the story.

Exercises to improve oral reading skill:

1) Read longer thought units for practice.

2) Read easier material to gain fluency.
3) Dramatize stories reading the character parts.

In the intermediate and upper grades, these activities may be important to stress in the instructional program:

1) Visual recognition: noting the importance of pictures as a clue to recognition, interpreting maps, graphs, and time lines, noting the meaning of signal words in paragraph structure.

2) Auditory recognition: observe the sounds in accented and unaccented syllables, check mastery of vocabulary meaning through word discrimination.

3) Comprehension in context: recognizing antonyms and synonyms, and homonyms, studying word derivatives.

The administrator who has the final responsibility for these children must become aware of the nature and manifestations of neurological disorganization such as:

1) Confusion children experience in directional patterns;

2) If the school is in a high socio-economic area he must not overlook neurological disorganization as a cause of reading disability.

3) Examine profiles of each class for disability patterns;

4) With teachers he must stress:
   a) When testing for laterality look to eyedness rather than handedness as the determining factor;

   2) Build upon the strengths of neurologically disorganized children as indicated in test profiles;

   3) Avoid the "osmosis approach"; use direct training rather than incidental instruction.

"Action," to be more than a "Don Quixote attack on a modern windmill" depends on the concerted effort of all school personnel.
Further Needed Research

A serious limitation of the causal-comparative method of research is that the investigator must start with the observed effects and try to discuss the possible causes or antecedents of these effects. This causal-comparative field study followed by the experimental-laboratory study is a productive sequence for the researcher to follow. It is for this reason that the following areas are suggested as means of further research. These are investigations that should clarify points made in this study, and which will offer answers to the continuing challenge of every generation: the education of its children. Because of the obvious importance and necessity for bringing every bit of scientific knowledge to the attention of educators further investigations may serve to broaden the conclusions already reached in this study.

(1) This study suggests that a significant proportion of children with reading disability display poor neurological organization and that in these children there is evidence of less efficient comprehension in context, visual and auditory recognition and oral reading skill. If these syndromes can be linked with incomplete cerebral dominance, it might be said that these patterns of disability reflect functions in the two hemispheres.

(2) Other studies done in this area with disciplines of neurology and psychology may consider whether this maldevelopment is constitutional, i.e., genetically determined, or whether it is due to such a factor as minimal brain damage at birth.

(3) It has to be considered why all poorly-organized children do not exhibit reading disability. Such an investigation would offer a positive contribution to this field.

(4) Reviews of the literature in the areas of cerebral dominance, (handedness, eyedness, footedness) and general neurological organization could
well become an integral part of the elementary school program and this study may point the way to the establishment of such programs. Particularly at the kindergarten and primary levels we may look to studies that will attempt to show the effects of an organization program with children who have not become lateralized.

(5) The case studies showed the positive effects of a modified program of retraining; we may expect other investigations, using larger numbers and more controlled circumstances, to substantiate these findings.

(6) An attempt should be made where groups chosen from distinct social classes would be tested neurologically and programs set up for the experimental group to substantiate the assumption that neurological organization is a factor irrespective of social class and that neurological disorganization can be prevented through a definite program.

It is difficult to arrive at any clear cut conclusions. If it is agreed that reading disability is more frequently found among poorly organized children and this further implies atypical cerebral dominance, it would follow that atypical cerebral dominance is characteristic of a proportion of disabled readers. This may result from brain injury, maturation, or an emotional problem. Or it may be due to a combination of these factors.

These comments re-emphasize to the educator the responsibility that is his. A fuller understanding of reading and its disorders must presuppose fuller understanding of the ways in which asymmetrical functions become established in the human brain. This provides the challenge that must be accepted by educators, reading specialists, neurologists and psychologists, who working as a team provide insights built on earlier research and substantiated by current experimentation.

APPENDIX I

IOWA TEST OF BASIC SKILLS
Marking Your Name

Your answers to the test exercises will be marked on a separate answer sheet. The answer sheet will be scored by a machine. This machine will also "read" and copy your name from the answer sheet. To make this possible, you must mark your name in a special way on the "name block" on the answer sheet.

Look at the Sample Name Block below. This block has been marked for ARTHUR L. SWANSON. The name has been printed in the row of boxes across the bottom of the block. Notice that the last name is printed first, then the first name, then the middle initial. Notice, too, that a box has been left blank after SWANSON, and one after ARTHUR, to separate these parts of the name.

Notice that in the alphabet above each letter the same letter has been covered with a heavy black mark. The S has been blackened above the S in SWANSON, the W above the W, and so on. Nothing is blackened above the empty box after SWANSON.

Study this sample carefully. Do not mark your own name on your answer sheet until you are told to do so.

SAMPLE NAME BLOCK

SWANSON ARTHUR L

This test booklet is used by pupils in grades 3-9. You will answer some exercises in each of eleven tests, but never all the exercises in any test. The directions for each test will tell you where to begin and where to stop work on that test. Your answer sheet also will help you to keep the right place. It has answer spaces for mark-

Marking the Test Exercises

To help you understand how to answer the test exercises, practice test is given on this page. In each exercise, you are to decide which one of the four numbered words has most nearly the same meaning as the word in heavy black type above the test. The right answer has already been marked for each exercise. This was done by filling in a little circle. You are not to make any marks on this page.

### PRACTICE TEST

<table>
<thead>
<tr>
<th>Exercise</th>
<th>Option 1</th>
<th>Option 2</th>
<th>Option 3</th>
<th>Option 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. A large lake</td>
<td>small</td>
<td>pretty</td>
<td>big</td>
<td>tiny</td>
</tr>
<tr>
<td>2. The nice lady</td>
<td>man</td>
<td>woman</td>
<td>boy</td>
<td>girl</td>
</tr>
<tr>
<td>3. I am glad</td>
<td>hungry</td>
<td>sleepy</td>
<td>sad</td>
<td>happy</td>
</tr>
</tbody>
</table>

In the test that you are about to take, the rows of circles are on the separate answer sheet instead of on the test page. There is a row of circles numbered to match each test exercise.

To mark an exercise, decide first which is the best answer. Then, on the answer sheet, find the row of circles numbered the same as the question. Make a round black mark in the circle for the best answer.

There are three important things to remember in marking:

1. **Make a heavy round mark.** The mark should be large enough to fill the circle, but it should not go outside the circle. Do not waste time making very neat marks. It is more important to make very black marks. Be sure to use a soft pencil.

2. **Keep your place on the answer sheet.** Make certain each time that your mark is placed in the row numbered the same as the exercise.

3. **Mark only ONE circle in a row.** If you change your mind about an answer, erase your first mark as completely as you can.

MAKE NO MARKS ON ANY PAGES OF THIS TEST BOOKLET. Other pupils will use the same booklet later. Do not fold or bend your answer sheet.
76. Recollect the address
   1) remember
   2) recognize
   3) request
   4) record

77. A Chinese proverb
   1) gown
   2) saying
   3) pointing
   4) word

78. To predict the winner
   1) forecast
   2) applaud
   3) announce
   4) congratulate

79. Efficient workers
   1) tireless
   2) capable
   3) typical
   4) lazy

80. To execute the order
   1) carry out
   2) disobey
   3) issue
   4) cancel

81. Restrained by his friends
   1) approved of
   2) deserted
   3) held back
   4) encouraged

82. Was decidedly wrong
   1) possibly
   2) often
   3) rarely
   4) definitely

83. To astound his listeners
   1) bore
   2) shock
   3) inform
   4) appeal to

84. Find several defects
   1) obstacles
   2) traces
   3) pieces
   4) faults

85. Choose their delegate
   1) representative
   2) president
   3) officer
   4) candidate

86. The souvenir of her visit
   1) pleasure
   2) purpose
   3) remembrance
   4) memory

87. A logical ending
   1) familiar
   2) surprise
   3) disappointing
   4) reasonable

88. To banish the traitor
   1) put in prison
   2) send out of the country
   3) determine the guilt of
   4) decide on punishment for

89. A devout prayer
   1) sincere
   2) daily
   3) tearful
   4) silent

90. To impersonate the professor
   1) imitate
   2) interrupt
   3) impress
   4) make fun of

91. The shrewd general
   1) retired
   2) aged
   3) confident
   4) clever

92. To destitute the odor
   1) produce
   2) eliminate
   3) detect
   4) dislike

93. To quell the disturbance
   1) add to
   2) calm
   3) investigate
   4) create

94. A dilapidated castle
   1) damp and drafty
   2) well-preserved
   3) closely guarded
   4) partly ruined

95. Please be punctual
   1) ready
   2) prompt

96. A familiar refrain
   1) warning
   2) song
   3) scene
   4) face

97. A valiant deed
   1) courageous
   2) wicked
   3) dangerous
   4) worthy

98. To span the river
   1) dam up
   2) widen and deepen
   3) extend across
   4) travel on

99. A happy vagabond
   1) visitor
   2) tramp
   3) pioneer
   4) soldier

100. Show little zeal
    1) eagerness
    2) ability
    3) patience
    4) emotion

101. Consumed the pie
     1) stole
     2) spoiled
     3) devoured
     4) divided

102. Point out the distinction
     1) difference
     2) direction
     3) weakness
     4) connection

103. Make a wager
    1) decision
    2) speech
    3) bet
    4) remark

104. Implied what was wrong
     1) suspected
     2) did not say
     3) hinted
     4) investigated

105. Offer no opposition
     1) assistance
     2) explanation
     3) suggestion
     4) resistance

106. To sever the rope
     1) tangle
     2) tighten
     3) cut
     4) splice

107. The jubilant students
     1) guilty
     2) rejoicing
     3) brilliant
     4) mischievous

108. Comprehend the instructions
     1) follow closely
     2) be confused about
     3) understand
     4) make clear

109. To saunter out the door
     1) dash
     2) stroll
     3) skip
     4) stagger

110. A lenient judge
     1) fair
     2) severe
     3) merciful
     4) respected

111. Menaced the village
     1) threatened
     2) surrounded
     3) destroyed
     4) captured

112. Of dubious value
     1) double
     2) questionable
     3) genuine
     4) little

113. Have eccentric ideas
     1) peculiar
     2) original
     3) clever
     4) strict

114. Admire his perseverance
     1) helpful attitude
     2) frank manner
     3) good nature
     4) steady effort
TEST V: VOCABULARY

Directions: In each exercise, you are to decide which one of the four words has nearly the same meaning as the word in heavy black type above them. On the answer sheet, find the row of circles numbered the same as the exercise you are working on. You are to fill in the circle on the answer sheet that has the same number as the answer you picked. The sample exercise in the right has already been marked correctly on the answer sheet.

6. To invite a friend
   1) write
   2) visit
   3) meet
   4) ask

7. To dash up the street
   1) ride
   2) walk
   3) hurry
   4) glance

8. Come here instantly
   1) sometime
   2) often
   3) at once
   4) soon

9. A queer name
   1) difficult
   2) foreign
   3) fancy
   4) strange

10. The silent water
    1) cool
    2) still
    3) moving

11. To mend the fence
    1) damage
    2) jump
    3) build
    4) repair

12. Intended to do it
    1) had
    2) planned
    3) remembered
    4) got ready

13. Accept the cash
    1) gift
    2) excuse
    3) money
    4) dare

14. The proper way
    1) easiest
    2) shortest
    3) safe
    4) right

15. To bother the neighbors
    1) respect
    2) greet
    3) disturb
    4) amuse
16. The shrieks of the children
   1) screams
   2) garments
   3) playthings
   4) whispers

17. A time to rejoice
   1) make plans
   2) be happy
   3) retreat
   4) begin again

18. The spare room
   1) large
   2) special
   3) extra
   4) quiet

19. To recover the money
   1) get back
   2) spend
   3) bury
   4) earn

20. Enjoy the voyage
   1) program
   2) party
   3) letter
   4) journey

21. Gaze at the picture
   1) laugh
   2) stare
   3) point
   4) throw

22. To terrify the animals
   1) slaughter
   2) tend
   3) frighten
   4) round up

23. The whole supply
   1) complete
   2) regular
   3) usual

24. Welcome a visitor
   1) stranger
   2) guest
   3) companion
   4) relative

25. The sway of the trees
   1) movement
   2) appearance
   3) shadow
   4) height

26. A keen knife
   1) dull
   2) sharp
   3) bent
   4) shiny

27. To pluck the flowers
   1) arrange
   2) plant
   3) grow
   4) pick

28. Speak distinctly
   1) clearly
   2) softly
   3) harshly
   4) slowly

29. A savage tribe
   1) friendly
   2) brave
   3) warlike
   4) powerful

30. To plead for help
   1) send
   2) wait
   3) search
   4) beg

31. To publish the name
   1) dislike
   2) choose
   3) announce
   4) recall

32. A vast farm
   1) huge
   2) dusty
   3) fertile
   4) run-down

33. Broke it deliberately
   1) into pieces
   2) on purpose
   3) by accident
   4) with a loud noise

34. The sentinel at the entrance
   1) tower
   2) bell
   3) arch
   4) guard

35. To inspect the papers
   1) collect
   2) arrange
   3) examine
   4) conceal

36. The gradual increase
   1) slow
   2) noticeable
   3) enormous
   4) immediate

37. Inquire his name
   1) ask
   2) sign
   3) remember
   4) look up

38. Multitude of flowers
   1) study
   2) arrangement
   3) scent
   4) great number

39. Respect his wisdom
   1) advice
   2) age
   3) knowledge
   4) courage
Sections: This test consists of several reading selections. For each selection there are some questions.

Read each selection quickly and then answer the questions. Four answers are given for each question, but only one of these answers is right. You are to choose the one answer that you think is better than the others. Then, on your answer sheet, find the row of circles numbered the same as the exercise. Fill in the circle for the best answer.

The sample exercise at the right shows you how to mark your answers on the answer sheet.

SAMPLE EXERCISE

Thumper is a big friendly dog. He likes to follow the fire trucks.

S1. What does Thumper like to do?

1) Watch fires
2) Bite firemen
3) Run after the fire trucks
4) Follow police cars

The sample exercise at the right shows you how to mark your answers on the answer sheet.

MAKE NO MARKS IN THIS BOOKLET
When my brother Ted and I were sick, a man from the health department came to our house. He put a sign with the words MUMPS—KEEP OUT on our door. When the other boys saw that red sign, they knew they could not play with us. We had to stay at home until the man came back and took down the sign.

1. Who is telling this story?
   1) Ted's mother
   2) Ted's brother
   3) One of Ted's playmates
   4) A man from the health department

2. What was the matter with Ted?
   1) He did not want to play with the other boys.
   2) He did not like to go to school.
   3) He was angry with his sister.
   4) He was sick.

3. Why was the sign put on the door?
   1) To scare the people in the neighborhood
   2) To let the doctor know someone was sick
   3) To help keep other children from catching the mumps
   4) To tell the attendance officer why the children were not in school

4. Who took the sign down?
   1) The man who put it up
   2) Another man from the health department
   3) Ted's doctor
   4) Ted

5. What does this story show?
   1) That boys are more likely to catch mumps than girls
   2) That children will get sick if they play outdoors
   3) That the health department tries to protect children

Mary, Jane, and Helen were saving their money to buy a doll house. The price of the doll house was $4.50. The girls had saved $3.75. Their mother wanted to help them get some more money. She told them she would buy all the blueberries they could pick, and would pay them 30 cents a quart. She paid Jane 15 cents, Mary 30 cents, and Helen 60 cents. When the girls put all their money together, they had enough for the doll house, and 30 cents left over.

6. Which of these words tells who the girls the story were?
   1) Sisters
   2) Cousins
   3) Friends
   4) Neighbors

7. What were the girls planning to do with the money?
   1) Put it in the bank
   2) Give it to their mother
   3) Buy a present for their father
   4) Buy a toy they all wanted

8. How did their mother help the girls get the money they needed?
   1) She bought the blueberries they picked.
   2) She made blueberry pies for the girls to sell.
   3) She gave them some money she had saved.
   4) She asked their father to give them the money.

9. How many blueberries did Mary pick?
   1) Less than a quart
   2) One quart
   3) Two quarts
   4) There is no way of telling from the story.

10. How many blueberries did Helen pick?
    1) Fewer than either Jane or Mary
    2) Fewer than Jane and Mary together
    3) Just as many as Jane and Mary together
    4) More than Jane and Mary together

11. After their mother paid them, did the girls have enough money to buy the doll house?
    1) Yes, they had just enough money.
    2) Yes, they had enough money, and 30 cents more.
    3) No, they needed 30 cents more.
    4) There is no way of telling from the story.
A cowboy needs the kind of clothes he wears. His big felt hat with its high crown and wide brim protects his head when he rides in the hot sun or in the rain or snow. His gay neckerchief can be pulled up over his mouth and nose when the dust rises, or when the sleet and wind blow in his face. His heavy leather chaps serve as armor for his legs while he is riding through sagebrush or cactus, and they also shield him against rain and snow. The high, slanting heels on his boots help him to stay in his saddle when his horse gets frisky. When he is roping cattle on foot, the heels dig into the ground and keep him from being dragged.

While George Washington was president, the first United States mint was started at Philadelphia. Today the United States has a mint in Philadelphia, one in Denver, and one in San Francisco. All of our coins are made in these mints. You can tell where a coin was made by looking for the mint mark. The mint mark is a small letter. It is usually on the back of a coin. If a coin has a “D” on the back, it was made at the Denver mint. If it has an “S,” it was made in San Francisco. If it has a “P,” or if it has no mint mark at all, it was made in Philadelphia.

18. Where was the first United States mint?
1) In Washington 3) In Philadelphia
2) In Denver 4) In San Francisco

19. How many mints do we have now?
1) One 3) Three
2) Two 4) Four

20. What does the mint mark tell?
1) How old the coin is
2) Where the coin was made
3) How much the coin is worth
4) Who was president when the coin was made

21. If you want to see whether a coin has a mint mark, what will you look for?
1) A letter 3) A secret sign
2) A number 4) A man’s name

22. How can you tell if a coin was made in San Francisco?
1) It will have a picture of a bridge on it.
2) The mint mark will be an S.
3) It will be larger than the coins made in other cities.
4) It will not have a mint mark.

23. If a coin has no mint mark, what does that tell you?
1) The coin is not worth anything.
2) The coin was made in a mint that opened after this story was written.
3) The coin was made before the United States had a mint.
4) The coin was made in Philadelphia.

24. Which kind of money is not made in our mints?
1) Dollar bills 3) Dimes
2) Half dollars 4) Pennies
The Indians who lived on Long Island were tall, slender, straight, and strong. They had straight black hair and reddish brown complexions. They greased their bodies with bear fat to keep insects away from them. They also believed that it would make their arms and legs nimble. To keep their skin smooth, they used fish oil and eagle fat.

The Indians used to paint themselves, because they thought it made them look handsome, and also because they thought it would keep away bad luck and sickness. They used minerals and vegetables for making the paints. Red paint came from iron rust, white from finely ground shells, green and blue from the juice of berries or flowers, yellow from clay, and black from fire soot. For paint cups, they used small hollowed-out stones.

In painting themselves, the Indians usually put a spot of paint on each cheek. They also put paint on their eyelids, and on their foreheads. The color red meant power, success, or war. Blue meant trouble, black stood for death, and yellow was for joy or travel. White was for peace.

Usually, the Indian man wore just a breech cloth of skin, and the woman a short skirt of skins decorated along the bottom. For very special events, a robe of dressed deerskin or fur or turkey feathers was also worn. The children did not wear any clothes in summer until they were about thirteen years old.

It was very hard for the Indians to make their clothes. Animals had to be killed and skinned with very crude stone tools. Then the hides had to be tanned, and sewed with needles made out of bones and thread made from milkweed or animal sinews.

25. The Indians made most of their clothes out of which material?
1) Seaweed  2) Skins  3) The bark of trees  4) Homespun cloth

26. The Long Island Indians did not have
1) long legs.  2) curly hair.  3) strong muscles.  4) smooth skin.

27. Which of these did the Indians hope to frighten away by painting themselves?
1) Animals  2) Insects  3) Enemies  4) Bad luck

28. Paragraph 2 tells why the Indians paint themselves. What else does it tell?
1) How they made their paints  2) How they looked after they had painted themselves  3) What the different colors meant  4) What they used for paint brushes

29. For coloring matter for their paints, the Indians used all of the following except
1) shells.  2) berries.  3) fish oil.  4) clay.

30. When the Indians went out to fight, what color did they paint their faces?
1) White  2) Black  3) Red  4) Yellow

31. An Indian boy who was sent with a message of friendship to another tribe would probably paint himself with which color?
1) White  2) Red  3) Blue  4) Black

32. Out of what material did the Indians make their needles?
1) Milkweed stalks  2) Animal sinews  3) Stone  4) Bone

33. Which of these titles is a good one for the story?
1) "How Paint Was Made in Indian Days"  2) "How the American Indian Lived"  3) "Superstitions of Indian Tribes on Long Island"  4) "The Appearance and Dress of Long Island Indians"
The game “Jack Frost” is lots of fun to play. The object of the game is to keep from laughing when everyone else around you is laughing. Any number of players can play - the more the merrier! One player is chosen to be Jack Frost. All players except Jack Frost stand in a circle facing the center. Jack Frost goes round and round the outside of the circle quietly, touching a player here and there. As soon as a player feels the touch of Jack Frost, he begins to shiver and shake, exaggerating his motions in an effort to make the others laugh. The players who have not been touched try to keep from laughing as they see the others trying to “keep warm.” The job of keeping a straight face becomes harder and harder as the players who have been touched try to keep from laughing. As they see the others trying to “keep warm,” the job of keeping a straight face becomes harder and harder. The players who have been touched try to keep from laughing as they see the others trying to “keep warm.”

37. Why is it hard to keep from laughing?
1) The players look so funny trying to “keep warm.”
2) Jack Frost is dressed in a funny suit.
3) No one knows which player Jack Frost will touch next.
4) Jack Frost tries to tickle the players when he touches them.

38. What happens to a player who laughs before Jack Frost touches him?
1) He has to go around the circle with Jack Frost.
2) He has to keep shivering and shaking until the game is over.
3) He has to stop playing.
4) He plays the part of Jack Frost in the next game.

39. Why do the players go through so many funny motions?
1) They have to keep moving until Jack Frost touches them.
2) They want to make the other players laugh.
3) It is the only way they can keep warm.
4) The player making the funniest motions wins.

40. How is Jack Frost chosen?
1) By the winner of the last game
2) By drawing numbers
3) By counting out
4) The story does not tell.

41. Why is “Jack Frost” a good name for this game?
1) Because winter is the best time to play the game
2) Because the players act as if they were really cold
3) Because “Jack Frost” is a name that makes you want to laugh
4) Because one thinks of Jack Frost as a happy go-lucky person
Baby water turtles make fine pets. They are easy to care for and cheap to feed. What is more, they are friendly, interesting to watch, and fun to play with.

You can buy a baby water turtle in almost any pet shop or five and ten cent store. When you choose your turtle, be sure that his eyes are clear and his shell hard all over. Do not buy a turtle with paint on his back. The paint keeps the shell from growing properly.

The best home for your turtle is a glass tank. The tank should be about fourteen inches long, six inches wide, and six inches high. The bottom of the tank should be lined with a one-inch layer of gravel and pebbles. On one side of the tank there should be a beach made out of gravel and rocks. The rest of the tank should be filled with enough water to form a swimming pool about two inches deep.

Turtles like a warm climate. When they get cold, they go into a sleeping state. If you want your turtle to stay awake and active, keep his home in a warm place, and let him take a sun bath now and then. A temperature of between 70 and 85 degrees is ideal for a turtle home.

Baby turtles do not eat very much. They like raw meat or fish, green vegetables, and hard cheese. You can buy turtle food already prepared. If you fix your turtle’s food yourself, chop or shred it. The food should be served in portions about the size of your finger tip. Occasionally, you should treat your turtle to a live meal, such as an earthworm. If you feed your turtle at the same time every day, he will learn to look for you. He may learn to eat out of your hand.

Whenever you pick up your turtle to play with him, grasp him carefully but firmly around the middle of his upper shell. When you put him down, be very gentle. Until he gets to know you, a turtle will pull into his shell when he is picked up. But he will come out again as soon as he gets over his fear.

42. In this article what does the writer talk about first?
   1) How to take care of a baby water turtle
   2) Where to buy a baby water turtle
   3) Why baby water turtles make good pets
   4) What baby water turtles like to eat

43. What information in the article gives the basic idea of the price of baby water turtles?
   1) They are small.
   2) They eat very little.
   3) They live in simple homes.
   4) They are for sale in five and ten cent stores.

44. What is the main topic of paragraph 2?
   1) Where you can get the best turtle bargain
   2) How to choose your turtle
   3) Why you should pick a turtle with clear eyes
   4) The best time of year to buy turtles

45. In which paragraph are directions given for making a home for a turtle?
   1) Paragraph 3
   3) Paragraph 5
   2) Paragraph 4
   4) Paragraph 6

46. How much water should be placed in the tank?
   1) Just enough to cover the bottom
   2) Just enough to cover the turtle
   3) Just enough to allow the turtle to swim without touching the bottom
   4) Enough to fill the tank to within two inches of the top

47. In paragraph 5, the writer tells what baby turtles like to eat. What else does he tell?
   1) What they don’t like to eat
   2) How to teach your turtle to do tricks
   3) What time of day is best for feeding
   4) How the turtle’s food should be served

48. What does the writer give as a reason for feeding a turtle at the same time every day?
   1) He will be friendlier.
   2) He will be healthier.
   3) He will be happier.
   4) He will be easier to care for.

49. Which is probably the main reason why you are warned to handle your turtle gently?
   1) So that his shell will not break in two
   2) So that he will not snap at you
   3) So that you will not scare him
   4) So that you will not drop him

50. In this article all of the following subjects are discussed except
   1) what turtles like to eat
   2) how turtles should be handled
   3) why turtles need a warm place to live
   4) how fast turtles grow
Long ago in far away China there lived a little boy named Mencius.

One day Mencius came home in the middle of the day and told his widowed mother he was leaving school. His mother said nothing, but picked up scissors and slashed the piece of cloth she was cutting, cutting it right in two.

The boy cried out, “Oh, Mother, what have you done? That was such a beautiful pattern!”

“I have done just what you are doing, my son,” she answered. “If you leave your books, you will be cutting across the pattern of your life, just as I have ruined the pattern on my loom.”

Young Mencius was so impressed that he went back to school. Later he became a famous scholar and teacher.

55. Why did Mencius return to school?
1) He was afraid that his mother would punish him.
2) He felt sorry for his mother.
3) His mother begged him to go back.
4) His mother convinced him that it would be a mistake to quit.

56. Which is the best title for this story?
1) “A Stubborn Boy”
2) “The Ruined Cloth”
3) “A Wise Mother”
4) “Education in China”

57. What is this poem about?
1) Blowing bubbles
2) Washing clothes and taking care of children
3) April showers and May flowers
4) An apple orchard in summer

April is a laundress
Mixing silver suds
To rinse the lacy dance frocks
Of apple-blossom buds.

May Day is the nursemaid
Who looks the flowers over
And ties their little bonnets
On the buttercup and clover.

58. The poet uses “silver suds” to mean which of these things?
1) Raindrops
2) Rain clouds
3) Snowflakes
4) Soap suds

59. What are the “dance frocks” of the apple-blossom buds?
1) Their petals
2) Their leaves
3) The sunbeams shining on them
4) Spider webs

60. The poet talks about April and May as if they were
1) flowers
2) months
3) fairy godmothers
4) people.
The thistle of Scotland is said to be the oldest national flower on record. According to legend, it became Scotland’s national flower as a result of the part it played in the Battle of Largs, fought in 1263 while Alexander III was king. A war was being fought at the time between the Scots and the Norwegians, and an army of the Northmen led by King Haakon landed one night on the west coast of Scotland near the mouth of the Clyde River. Although this was not far from Alexander’s camp, the enemy landing was unobserved. The Norwegians regarded it as most improper to attack an enemy at night, but on this occasion the temptation to win an easy victory was so great that they decided not to wait for daylight. Barefooted, they crept noiselessly toward the Scottish camp in order to take the sleeping soldiers by surprise. Certain success seemed to be within their grasp when one of the Norwegians stepped on a thistle. Its prickles hurt him so that he cried out in pain. The alarm was, of course, given in the Scottish camp, and the defenders seized their weapons. They proceeded to drive the invaders from their shores, killing a great number of them. Since that time, so the legend goes, the thistle has been the national emblem of Scotland.

61. What does this story explain?
1) Where Scotland got its name
2) Why Scotland and Norway are old enemies
3) How the thistle became Scotland’s national flower
4) How wars were fought in early days

62. How did the enemy soldiers reach Scotland?
1) By land
2) By sea
3) By air
4) There is no way of telling from the story.

63. When did the Scots first learn of the approach of the enemy?
1) When they sighted the enemy ships near the mouth of the Clyde River
2) Not until the enemy was almost upon them
3) After the enemy had opened attack on them

64. Why did the Norwegians decide to attack while it was still dark?
1) They thought they were sure to win that way.
2) They did not want the Scots to see how small their army was.
3) They thought Alexander’s soldiers had already spotted them.
4) They were angry with the Scots for having broken the rule against night fighting.

65. What was the outcome of the fighting?
1) The Norwegians were defeated.
2) The Scots were driven from their own shores.
3) Neither side could claim a victory.
4) Both sides claimed a victory.

66. The story implies that the outcome of the battle might have been different if
1) Alexander’s men had been better fighters.
2) Haakon’s men had followed his orders.
3) the attackers had waited for daylight.
4) the Norwegians had been wearing shoes.

67. According to the story, the thistle is the national flower of Scotland because
1) so many thistles grow there.
2) the thistle has such a pretty flower.
3) the thistle once helped save Scotland from invasion.
4) Scotland was the first country to grow thistles.

68. About how long ago are the events in this story supposed to have taken place?
1) 100 years
2) 700 years
3) 1263 years
4) 3000 years

69. In the events described, the thistle was important because it was
1) handsome.
2) hardy.
3) prickly.
4) colorful.

70. When the writer calls this story a “legend,” what is he telling you?
1) It is a story about kings.
2) It is a story about soldiers.
3) It is an old story that is known to be historically correct.
4) It is a story handed down from earlier times that may or may not be true.
Many years ago an ornamental vine was brought to this country from the Orient. In the south it grew very well. It made such a fine, shady screen for the front porch that almost everybody used it for this purpose. In fact, it wasn't long before people were calling the plant "porch vine."

Then, a little more than thirty years ago, some scientists got interested in this plant, whose real name is kudzu. They noticed that it would grow almost anywhere in that warm climate. They also saw how quickly the new shoots sprouted. "Isn't there anything else we can use kudzu for?" they asked themselves.

The scientists began planting it in gullies to see if it would keep topsoil from being washed away in the heavy rains. "If it makes a good screen for the porch," they thought, "maybe it will make a good cover for the soil." And the plant did just that. Its long, trailing shoots spread over the ground quickly. At every joint it sent out roots that anchored the vines solidly into the ground. Then farmers discovered that cows liked to eat kudzu. They found it to be a very good plant for hay or pasture.

Today, kudzu protects the soil on thousands of acres of land and furnishes a valuable feed for livestock. Many Southern farmers who never had a good pasture before, now find they can have one by planting porch vine.

1. About how many years ago was kudzu first brought to the United States?
   1) About ten years ago
   2) A little more than thirty years ago
   3) About fifty years ago
   4) The story does not tell.

2. In which of these states is kudzu likely to be most widely grown today?
   1) Alabama
   2) Maine
   3) Texas
   4) South Dakota

3. Which of these happened first?
   1) Scientists experimented with kudzu as a cover crop.
   2) People in the South found that kudzu made a good porch screen.
   3) Farmers began using kudzu as feed for cows.
   4) Kudzu was planted on thousands of acres of land.

4. Why is kudzu able to keep the soil from washing away?
   1) The plants suck up most of the rain water.
   2) The plant has very long roots.
   3) The plant sends out many shoots, each with its own roots.
   4) The plant has wide, flat leaves.

5. Which use for kudzu was probably last to be discovered?
   1) As feed for livestock
   2) As a cover crop
   3) As a porch screen
   4) There is no way of telling from the story.

6. What does paragraph 1 tell us?
   1) How kudzu protects the soil
   2) What kudzu looks like
   3) How kudzu was first used in this country
   4) When kudzu was first brought to this country

7. What is the best heading for paragraph 3?
   1) "Growing habits of kudzu"
   2) "Conserving the soil"
   3) "Discovering new uses for kudzu"
   4) "Planting kudzu"

8. Three of these statements are shown by the story to be true. Which one is not true?
   1) Kudzu will climb, and it will grow on level ground.
   2) Kudzu will grow in almost any climate.
   3) Kudzu will grow in poor soil.
   4) Kudzu grows rapidly.

9. Which is the best name for this story?
   1) "A Plant with a Funny Name"
   2) "Conserving the Soil in the South"
   3) "The South Finds a New Crop in Its Front Yard"
   4) "How Kudzu Is Raised in the United States"
1 How are chickens able to peck so rapidly and accurately? Is it because they “just naturally know how to peck,” as most people would probably say? Or do chicks have to learn to peck in much the same way that a child has to learn how to feed himself?

2 A number of years ago a scientist decided to conduct an experiment that would reveal the answers to these questions. He had observed how poorly newly-hatched chicks peck, but how rapidly they improve. There were two possible ways of explaining this. It could be that the chicks become experts automatically as they grow older—“just naturally,” in other words. But it could also be that chicks learn to peck efficiently through practice. This, of course, takes some time, during which the chicks get older. But the practice is the important thing. In scientific terms, the first explanation would mean that pecking was a “result of maturation.” The second would indicate that pecking was “learned behavior.”

3 Before he could carry out his experiment, the scientist had to decide what he would call a “successful peck.” After studying chickens for a while, he found that a peck was really three different motions in one. There was the movement of the head toward the object, the movement of the beak in grasping the object, and the movement of swallowing. A chick had to make all three motions perfectly for a “successful peck.”

4 The scientist took 75 newly-hatched chicks and divided them into three equal groups. He was very careful that all the chicks were of the same kind. The three groups were kept in separate pens in a dark room. At one o’clock each day, the first group was brought into a lighted room. Each of the chicks in this group, called Group A, was allowed to take 50 pecks at grains of wheat. Then back into the dark room they went. The second group, called Group B, was brought to the lighted room next. The chicks in this group were allowed only 25 pecks each. Then they were returned to the dark room. Finally, Group C was brought in. The chicks were allowed only 12 pecks in the lighted room. The experiment was carried on for twenty days. A record was kept of the number of time each chick made a successful peck.

5 When the experiment was over, the scientist compared the records of the three groups. He found on the last day that the chicks of Group A had improved most, Group B next, and Group C least of all. Thus it seems that baby chicks must learn to peck. Even in the chicken world “practicing makes perfect.”

80. Which of these questions did the scientist want to answer?
1) How quickly do chicks learn to peck?
2) What kind of feed do chicks like best?
3) Is pecking a skill that must be learned?
4) Can chicks learn to peck in the dark?

81. Why did the scientist first spend time watching the chicks?
1) So that he could understand the pecking motion
2) So that he could tell his chicks apart
3) So that the chicks would become used to him
4) So that he could make sure none of the chicks were sick

82. In what way were the three groups treated differently?
1) They were given different kinds of food.
2) They were kept in different rooms.
3) They were given different kinds of pecking practice.
4) They were given different amounts of pecking practice.

83. Why were the chicks kept in a dark room?
1) So they could not get extra pecking practice
2) So one group could not see the others
3) So their eyes would not get used to sunlight
4) So they could learn to peck in the dark
Test L-1: Spelling

Directions: The exercises in this spelling test are like the ones shown at the right. Many of the exercises contain a mistake in spelling. Some do not have any mistakes at all.

You are to look for mistakes in spelling. When you find a mistake, fill in the circle on the answer sheet that has the same letter as the word which is wrong. If there is no mistake in the exercise, fill in the fifth circle.

The sample exercises at the right show what you are to do.

Use this table to find where your grade is to begin and stop on this test.

Test L-2: Capitalization

Sections: This is a test on capitalization. It will show whether you know which words in a sentence should be capitalized.

The exercises in the test are like the samples shown at the right. Many of the exercises contain mistakes in capitalization. Some do not have any mistakes at all.

You are to look for mistakes in the test exercises. When you find a mistake, fill in the circle on the answer sheet that has the same number as the line containing the mistake. If there is no mistake in an exercise, fill in the fourth circle.

The sample exercises at the right show what you are to do.

Use this table to find where your grade is to begin and stop on this test.

4) (No mistakes)
Directions: This is a test on punctuation. It will show how you can use periods, commas, question marks, apostrophes, etc.

The exercises in the test are like the samples shown at the right. Many of the exercises contain mistakes in punctuation. Some do not have any mistakes at all.

You are to look for mistakes in the test exercises. When you find a mistake, fill in the circle on the answer sheet that has the same number as the line containing the mistake. If there is no mistake in an exercise, fill in the fourth circle.

The sample exercises at the right show what you are to do.

Use this table to find where your grade is to begin and stop on this test.

2) (No mistakes)
Test L-4: Usage

Sections: This is a test on the use of words. It will tell whether you know how to use words properly in sentences.

The exercises in the test are like the samples shown on the right. Many of the exercises contain mistakes in the use of words. Some do not have any mistakes at all.

You are to look for mistakes in the test exercises. When you find a mistake, fill in the circle on the answer sheet that has the same number as the line containing the mistake. If there is no mistake in an exercise, fill in the fourth circle.

The sample exercises at the right show what you are to do.

Use this table to find where your grade is to begin and stop on this test.

   4) (No mistakes)
At the end of the program each pupil gave his mother a small present.
The boys pushed with all their might, but they couldn't move the boat by themselves.
By midnight the heavy clouds had blown away, and we could see hundreds of stars.
(No mistakes)

The meeting had already begun by the time we arrived.
One of my letters was returned because I had not put a stamp on the envelope.
Much of the gold which Captain Kidd is supposed to have buried has never been found.
(No mistakes)

Lightning had struck the tree, and a large limb had fell across the road.
This desk drawer is stuck so tightly that I can hardly get it open.
Mother asked me to try to take the top off the jar, but I couldn't do it either.
(No mistakes)

Pearls are not found in that kind of oyster.

Some people think rattlesnake meat is very good to eat.

There were so many apples on the tree that several of the branches had split.
(No mistakes)

The mountains in Pennsylvania are not so high as those in California.

Natalie had ought to save part of her allowance each week for Christmas presents.
This table rocks back and forth because one of the legs is too short.
(No mistakes)

Can you tell the difference between an oak leaf and a maple leaf?

Janet received more valentines than any other girl in the class.

We have a hammer, but there isn't any nails in the house.
(No mistakes)
Test W-1: Map Reading

Directions: This is a test of your ability to read maps. It contains several maps, with some questions about each one.

Four answers are given for each question, but only one of these answers is right. You are to choose the one answer that you think is better than the others. Then, on the answer sheet, find the row of circles numbered the same as the exercise. Fill in the circle for the best answer.

Use this table to find where your grade is to begin and stop on this test.

MAKE NO MARKS IN THIS BOOKLET
The picture map on this page shows the center town. Each of the most important buildings is marked. The signs for the streetcar line, the railway line, the bus line, and the bus stops are shown in the below the map.

13. What street is two blocks south of Maple Street?
   1) Birch Street  2) Station Street  3) Oak Street  4) Pine Street

14. Which building is on a street corner?
   1) The school  2) The post office  3) The fire station  4) The church

15. The park covers how many blocks?
   1) One  2) Two  3) Three  4) One cannot tell from the map.

16. Which of these is closest to a bus stop?
   1) The public library  2) The bank  3) The fire station  4) The police station

17. On which corner does the bus line cross the streetcar line?
   1) Birch Street and Fourth Avenue  2) Elm Street and Third Avenue  3) Elm Street and Fourth Avenue  4) It does not cross the streetcar line on this map.

18. Sally lives two doors from the public library. John lives south of the park. Which has the shorter way to school?
   1) Sally  2) John  3) Neither. They live the same distance from school.  4) One cannot tell for sure.

19. Which street is the longest?
   1) Birch Street  2) Elm Street  3) Maple Street  4) One cannot tell from the map.
The map below is a map of a Make-Believe country. There are four states in this country, numbered I, II, III, and IV. The key at the bottom of the page tells what the signs on the map mean.

21. Which city is located where two rivers meet?
   1) Clay
   2) Morris
   3) Pablo
   4) Tides

22. Which state has the most mountains?
   1) I
   2) II
   3) III
   4) IV

23. Which railroad trip from Tides would be shortest?
   1) To Clay
   2) To Low
   3) To Morris
   4) To Pablo

24. On which train trip might you be able to look at the sea all the way?
   1) Between Clay and Morris
   2) Between Pablo and Low
   3) Between Morris and Tides
   4) Between Tides and Pablo

25. Which river is longest?
   1) Beaver River
   2) Duck River
   3) Nes River
   4) Tin River

26. Three of the states meet at one point on the map. Where is the point located?
   1) In the mountains
   2) In a city
   3) In the middle of a lake
   4) Where a railroad crosses a river

27. If you wanted to go from Morris to Ross, which of these ways of traveling would probably be fastest?
   1) River boat to Tides, then boat
   2) Train to Clay, then boat
   3) Train to Tides, then boat
   4) Train to Pablo, then boat
The maps below show a make-believe country. There are five states in this country, numbered I, II, III, IV, and V. The large map at the top shows the major rivers, mountains, highways, and railroads. The small map at the bottom shows the livestock and crop production. The names of the cities and towns are in alphabetical order, beginning near the top.

1. Alva  
2. Baxter  
3. Doyle  
4. Ebro

29. On which river would you expect to find the most traffic?
1. Bon  
2. Fox  
3. Hile  
4. Lino

30. Ships leaving Doyle would most likely be loaded with which of these?
1. Pork and beef  
2. Woolen goods  
3. Wheat flour  
4. Bales of cotton

31. In driving from Baxter to Alva, what would one see in great numbers along the highway?
1. Mountains  
2. Sheep ranches  
3. Fields of cotton  
4. Fields of corn and wheat

32. Which railroad goes through a mountain pass?
1. The railroad from Alva to Cole  
2. The railroad from Baxter to Cole  
3. The railroad from Glacier to Hope  
4. The railroad from Hope to Klee

33. About how far is it by airplane from Lubec to the nearest city on the mainland?
1. 75 miles  
2. 120 miles  
3. 165 miles  
4. 230 miles

34. Where are the most sheep raised?
1. Near the ocean  
2. Where there is plenty of corn for feed  
3. Where cattle and hogs are also raised  
4. Where the land is rough and mountainous

35. How do the railway and the highway distances between Baxter and Hope compare?
1. The railway distance is greater.  
2. The highway distance is greater.  
3. The two distances are the same.  
4. One cannot tell from the map.

36. Which of these cities is shown in the picture above?
1. Baxter  
2. Cole  
3. Fay  
4. Jasper

37. In which of these cities is there certain to be a railroad bridge over a river?
1. Baxter  
2. Doyle  
3. Hope  
4. Klee
The map on this page is a part of a road map. To help you to find any city or town shown on the map, the names of the cities and towns appear in alphabetical order, beginning near the top.

39. Which of these is a true statement about Highway No. 17?
1) It is a four-lane state highway.
2) It is a paved state highway.
3) It is a paved county road.
4) It is a paved U.S. highway.

40. Beston is what direction from Lux?
1) Northwest
2) Northeast
3) Southwest
4) Southeast

41. In driving from Lux to Butte, how many side roads would you pass by?
1) Two
2) Three
3) Four
4) Five

42. A man from Lux is driving home from Blue Lake. How many miles will he save by taking Highway No. 17 rather than going through Fulton?
1) 2
2) 3
3) 4
4) 6

43. Where would this road sign be located?
1) At Elms
2) At Durham
3) At the junction of Highways No. 9 and 2
4) One cannot tell from the map.

44. How many of the cities shown along Highway No. have populations of more than 5000?
1) None
2) One
3) Two
4) Three

45. At which of these towns is there no highway junction?
1) Elms
2) Fulton
3) Galt
4) Nusk

46. A man in Lux wants to be in Galt in one hour. How fast must he drive, on the average?
1) 25 miles per hour
2) 30 miles per hour
3) 40 miles per hour
4) 54 miles per hour

47. If Highway No. 54 were blocked off for the first thirty miles south of Eden, what route from Lux to Eden would be the best?
1) Highways No. 54, 3, and 9
2) Highways No. 54, 5, and 9
3) Highways No. 54, 1, and 54
4) Highways No. 17, 2, and 9
Directions: This is a test of your ability to read graphs and tables. After each graph or table there are several questions. For each question, decide which answer is correct. Then mark the proper circle on the answer sheet. Mark only one circle for each question.

Use this table to find where your grade is to begin and stop on this test.

1. Who read the most books?
   1) Betty 3) David
   2) Pete 4) Tom

2. How many books did David read?
   1) 14 3) 17
   2) 16 4) 18

3. How many more books did Pete read than Tom?
   1) 1 3) 4
   2) 3 4) 6

4. What was the total number of books read by David and Tom?
   1) 10 3) 27

5. The 25th comes on what day?
   1) Tuesday 3) Thursday
   2) Wednesday 4) Friday

6. On what day does the month start?
   1) Sunday 3) Thursday
   2) Monday 4) Saturday

7. What is the date of the third Sunday in the month?
   1) 3rd 3) 20th
   2) 7th 4) 21st

8. One week from the 12th is what date?
   1) 13th 3) 19th
   2) 14th 4) 20th
1. How did the number of men's hats turned in during one month.

2. About how much money was turned in?

3. The drawing below shows the number of things which were turned in to the Lost and Found Department at a movie theater during one month.

4. For which article were sales better on Friday than on Thursday?

5. How many boxes of crayons were sold on Tuesday?

6. What was the total number of pencils sold?

7. On which day did the store sell the greatest number of the supplies listed?

8. For which article did the store sell the greatest number of the supplies listed?

9. How many boxes of crayons were sold on Wednesday?

10. How many of the articles turned in to the Lost and Found were returned to their owners?

11. For which of these takes Sue exactly one-half her time?

12. Which of these takes Sue 12 minutes?

13. What time is it when Sue finishes washing her face and brushing her teeth?

14. Which of these takes Sue exactly one-half much time as eating breakfast?

15. How many men's hats turned in compare with the number of women's hats?

16. About how much money was turned in?

17. Which of these takes Sue 12 minutes?

18. What time is it when Sue finishes washing her face and brushing her teeth?

19. Which of these takes Sue 12 minutes?

20. Which of these takes Sue exactly one-half much time as eating breakfast?
Which of the following sometimes lives to be 25 or more years old?
1) Cat  2) Dog  3) Goat  4) Horse

How long do some sheep live?
1) 14 years  2) 18 years  3) 20 years  4) 25 years

According to the drawing, how many of the animals listed have been known to live longer than 20 years?
1) 1  2) 2  3) 6  4) 10

The oldest lion in a large zoo would probably be about how old?
1) 5  2) 35  3) 50  4) 100

28. What kind of appliances are most expensive to run?
1) The largest ones
2) Those which supply light
3) Those which supply heat
4) Those which have motors

Every year on Fred's birthday his father measured his height. He then made a drawing which showed how tall Fred was at each age. This is the way it looked when Fred was in the fifth grade.

29. About how tall was Fred when he was in the fifth grade?
1) 30 inches  2) 40 inches  3) 50 inches  4) 55 inches

30. During which year did Fred grow fastest?
1) The first year of his life
2) The year after his first birthday
3) The year after his fifth birthday
4) The year after his tenth birthday

31. At what age was Fred twice as tall as he was at birth?
1) Two  2) Four  3) Six  4) Eight

32. About how many inches did Fred grow between his first and second birthdays?
1) 1  2) 5  3) 10  4) 35

33. What is the average monthly rainfall for September in Miami?
   1) 1.3 inches
   2) 2.6 inches
   3) 9.0 inches
   4) 81 inches

34. In which of these cities is April the driest month of the year?
   1) Fairbanks
   2) Memphis
   3) Miami
   4) San Francisco

35. Which two cities have most nearly the same average temperature in May?
   1) Fairbanks and Memphis
   2) Phoenix and San Francisco
   3) Memphis and Miami
   4) Miami and Phoenix

36. Which day generally is warmer, January 15 in Miami or July 15 in San Francisco?
   1) January 15 in Miami
   2) July 15 in San Francisco
   3) They are about equally warm.
   4) The table gives no clue to the answer.

37. Which city may be said to have cool summers and mild winters?
   1) Fairbanks
   2) Memphis
   3) Phoenix
   4) San Francisco

38. Which two items together account for exactly one-half of the total?
   1) Lodgings and retail purchases
   2) Lodgings and transportation
   3) Retail purchases and transportation
   4) Transportation and meals

39. Which type of expense ranks fourth?
   1) Transportation
   2) Lodgings
   3) Retail purchases
   4) Theaters and other amusements

40. One-fifth of each dollar is spent for what?
   1) Lodgings
   2) Meals
   3) Admissions to travel attractions
   4) Lodgings and transportation

41. On which of these days did Mike weigh the least?
   1) The first day
   2) The 10th day
   3) The 20th day
   4) The 58th day

42. Pat's weight was the same for which of these days?
   1) The 4th and 30th
   2) The 10th and 25th
   3) The 12th and 42nd
   4) The 16th and 54th

43. During which of these periods did Pat's weight change least?
   1) The 1st to the 5th day
   2) The 21st to the 25th day
   3) The 30th to the 35th day
   4) The 50th to the 55th day

44. What happened when milk was added to Mike's diet?
   1) He started to gain weight on the very first day.
   2) His weight doubled the first week.
   3) He continued to lose weight for a few days.
   4) He stopped losing weight but did not gain immediately.

45. When was the difference in weight between two rats the greatest?
   1) The 20th day
   2) The 24th day
   3) The 30th day
   4) The 52nd day

46. How long after the change in diet did it take Mike to catch up to Pat in weight?
   1) 3 days
   2) 17 days
   3) 31 days
   4) 37 days

A sixth-grade class conducted an experiment to study the importance of milk in the diet. Two white rats, Pat and Mike, were fed the same diet for the first 20 days except that Pat was given milk and Mike received water. On the day Mike began getting milk with his food, while Pat got water to drink. This is a record of their weights during the experiment.
Directions: This is a test of study skills such as looking up words, alphabetizing, using an index, and locating information.

Read the directions for each part carefully, and then mark your answers to the questions on your answer sheet.

Use this table to find where your grade is to begin and stop on this test.

3. Which of these is most often thought of as "jocose"?
   1) A fireman
   2) A clown
   3) A bus driver
   4) A thief

   MAKE NO MARKS IN THIS BOOKLET

In each of the next three exercises, decide which word in the list has been left out of the sentence.

4. Scotch tape will not ___ to anything that has oil on it.
   1) adhere
   2) concede
   3) desist
   4) lave

5. Peggy had spent all her money Christmas shopping and was ___ with packages.
   1) adhered
   2) desisted
   3) laden
   4) lucid

6. Stan's home run broke up the ball game in more ways than one. The lady whose window he broke was ___.
   1) irate
   2) jocose
   3) lucid
   4) mobile

What is the correct spelling of the word which means "stop"?
   1) disest
   2) desist
   3) disist
   4) dezist

Which is the correct spelling of the word meaning "easily moved"?
   1) mobel
   2) jocose
   3) mobele
   4) mobile
of the week on which Christmas Eve comes this year?
1) A map 3) The Bible
2) A calendar 4) Christmas Eve in Holland

8. Which would you use to find the distance from Denver to Chicago?
3) The National Geographic Magazine 4) A map of the United States

9. Which of these books would help you use the word *obtrusive* correctly?
1) A spelling book 3) A dictionary
2) A language book 4) Pocketful of Rhymes

10. Where would you look for help in writing a letter of invitation?
1) In a language book 2) In a spelling book
3) In a children’s magazine 4) In a book of games

11. Which of these is sure to be a fairy tale?
1) *The Prince and the Dwarfs* 2) *Tim and Tom*
3) *My Animal Friends* 4) *Life in a Log Cabin*

12. If you wanted to learn something about the different kinds of bears, which book would you choose?
1) *How the Bear Lost His Tail* 2) *Junior Bear Goes to Town*
3) *Bears of North America* 4) *Bimbo, the Talking Bear*

13. If you wanted to know what to feed a white rabbit, which book would help you?
1) *Farm Animals* 2) *Food for the Nation*
3) *Bugs Bunny Picture Book* 4) *How to Care for Your Pets*

14. Which of these books would be sure to contain stories about Indians?
1) *Saddle Boy* 3) *Then and Now*
2) *Tongue Talk* 4) *Along the Pacific*

15. 1) habitual 2) girl
3) effort 4) iceman

16. 1) wallet 2) usual
3) waffle 4) vacant

17. 1) tadpole 2) rascal
3) sabre 4) punch

18. 1) gist 2) friend
3) garlic 4) habit

19. 1) people 2) rat
3) rage 4) pole

20. 1) rock 2) saddle

AIDS TO USING THIS SAMPLE DICTIONARY:

1. Key words for pronunciation: âge, âdd, âc·count, câre, ârm, âsk, sofâ; âve, hēre, âvent, ând, sîlènt, makēr; âce, ill, charity; âld, âbey, ârb, âdd,âcon·nect; foâd, âbst; out, oil; âu·be, âûnîte, ârm, âp, cir·câs.

2. Syllables are indicated by a dot (·) or by the light (') or heavy (') accent mark.

3. Abbreviations used: adj., adjective; adv., ad·verb; n., noun; pl., plural; v., verb.

51. Which of these spellings of the word meaning "to observe with ceremony" is correct?
   1) sollemnize
   2) solemnise
   3) solemniz
   4) solemnize

52. How many syllables are there in chimera?
   1) chi
   2) chim
   3) me
   4) ra

53. Which letters make the accented syllable of chimera?
   1) b
   2) e
   3) the first n
   4) g

54. Which letter in benign is silent?
   1) b
   2) e
   3) the first n
   4) g

55. Celerity comes closest in meaning to which of these words?
   1) alacrity
   2) benign
   3) decorum
   4) factotum

56. Which meaning given in the dictionary fits the word due in this sentence? "Sue's absence was due to illness."
   1) Number 1
   2) Number 2
   3) Number 3
   4) Number 4

57. How is the plural of matrix spelled?
   1) matrices
   2) matriez
   3) matrixs
   4) matriks

58. Which of these words rhymes with Thames?
   1) James
   2) gems
   3) lambs
   4) came

59. Which of these would be described as precocious?
   1) A three-year-old child who can walk
   2) A four-year-old child who can read
   3) A boy who gets to school an hour early
   4) A dog that can sit up and beg

60. Which of these words best fits in this sentence? "His noisy conduct disturbed the _____ of the meeting."
   1) alacrity
   2) callow
   3) decorum
   4) solemnize
61. If you wanted to read about the city of Rome, the capital of Italy, which volume would you choose?
   1) Volume 2  2) Volume 4  3) Volume 7  4) Volume 8

62. Arizona and Utah are among the leading states in copper production. Which volume would tell about some of the uses of this mineral?
   1) Volume 1  2) Volume 2  3) Volume 5  4) Volume 6

63. Which volume would tell whether tigers are found in the jungles of India and Africa?
   1) Volume 1  2) Volume 4  3) Volume 7  4) Volume 8

64. Which volume might have pictures of the robin, the sparrow, the hawk, and the crow?
   1) Volume 1  2) Volume 2  3) Volume 3  4) Volume 7

65. In which volume would you read about Daniel Boone, the famous pioneer from Kentucky?
   1) Volume 1  2) Volume 2  3) Volume 4  4) Volume 6

66. If you wanted to read how iron, silver, and gold are obtained, which volume would you select first?
   1) Volume 3  2) Volume 4  3) Volume 5  4) Volume 7

In the exercises below you are to choose a word that would appear first if the four words were arranged in alphabetical order.

67. 1) fable  2) ending  3) drowsy  4) duck

68. 1) lumber  2) number  3) lump  4) lunch

69. 1) strangle  2) table  3) sprinter  4) talkative

70. 1) garble  2) garb  3) garbage  4) garage

71. 1) making  2) maple  3) marble  4) nab

72. 1) defend  2) defective  3) detective  4) defensive

73. 1) limb  2) limbate  3) limber  4) limbo

74. 1) numb  2) numbnness  3) numbly  4) mumps

75. 1) kilogram  2) kilo  3) kilowatt  4) kilometer

76. 1) Pearson, O. M.  2) Patterson, Jim F.  3) Person, Albert K.  4) Parson, B. T.

77. 1) Kearney, B. K.  2) Keatman, Hugh H.  3) Keatman, A. T.  4) Kearnice, B. T.

78. 1) Sherman, T. D.  2) Shermim, John L.  3) Sherman, R. M.  4) Shimon, R. M.

79. 1) Russell Grocery Co.  2) Russell, Fred T.  3) Russell, Fred W.  4) Russell Furniture

81. 1) Self-Service Grocer  2) Self-Sealing Door  3) Selfburg, A. B.  4) Selzer, Sidney

82. 1) Lindsey, M. R.  2) Lind, Erik  3) Linder, B. T.  4) Lindgren, James D.
Test A-1: Arithmetic Concepts

Directions: This is a test of how well you understand the number system and the terms and operations used in arithmetic.

Four answers are given for each question, but only one of these answers is right. You are to choose the one answer that you think is better than the others. Then, on the answer sheet, find the row of circles numbered the same as the exercise. Fill in the circle for the best answer.

Use this table to find where your grade is to begin and stop on this test.

5. Which of the figures above is a square?
   1) A  3) C  2) B  4) D

6. What time is it by this clock?
   1) 20 minutes to 12  2) 20 minutes after 11  3) 5 minutes to 4  4) 5 minutes after 4

7. How would you write seven dollars and thirty-eight cents in figures?
   1) $7.38  3) 7.38¢  2) $7.38  4) $738

8. Gloria visited her cousin in the country for two weeks. How many days did she stay?
   1) 7  3) 12  2) 10  4) 14
10. How much money is shown above?
   1) 51¢ 3) 87¢ 2) 76¢ 4) 96¢

11. Which of the figures above is divided into fifths?
   1) A 3) C 2) B 4) D

12. How many minutes are there from 10 o'clock to 11 o'clock?
   1) 30 3) 60 2) 50 4) 100

13. What is the largest number that can be written by using the figures 3, 6, and 9 once each?
   1) 693 3) 639 2) 936 4) 963

14. In counting, Sue said, "16, 19, 22, 25, 28, 31." How was she counting?
   1) By 2's 3) By 4's 2) By 3's 4) By 5's

15. Which of the lines above is about 1 inch long?
   1) a 3) c

16. Uncle Martin carries his lunch to work each day. How much coffee does he probably take?
   1) ½ gallon 3) 3 quarts 2) 1 pint 4) 1 gallon

17. Which of these numbers is larger than 6 but smaller than 9?
   1) 5 3) 9 2) 7 4) 11

18. Which of these groups of coins is equal in value to a dollar?
   1) 10 dimes 3) 5 quarters 2) 50 pennies 4) 25 nickels

19. Which group of three months is in the proper order?
   1) March, April, February 2) May, July, June 3) September, August, October 4) November, December, January

20. How would you read 2803?
   1) Two thousand eight hundred three 2) Twenty-eight thousand three 3) Two hundred eighty thousand three 4) Two thousand eighty-three

21. Only 4 oranges are left in the grocer’s bin. How many must he take from a new crate to make a dozen?
   1) 2 3) 8 2) 6 4) 11

22. Which of these numbers is the smallest?
   1) 1007 3) 732 2) 1121 4) 498

23. Jack has the coins shown above. How much money can he spend and still have 17¢ left for bus fare?
   1) 31¢ 3) 35¢ 2) 34¢ 4) 36¢
1. Which one of the number facts below does not belong to the same family or group as 15 - 11 = 4?
   1) 11 + 4 = 15
   2) 15 - 4 = 11
   3) 7 + 4 = 11
   4) 4 + 11 = 15

3. Larry built a kite 2 feet long. How many inches long did he make it?
   1) 18
   2) 20
   3) 24
   4) 36

5. Which of the figures above is one-fourth shaded?
   1) A
   2) B
   3) C
   4) D

7. Which one of these addition facts is not shown by either of the pictures above?
   1) 4 + 2 = 6
   2) 3 + 3 = 6
   3) 2 + 4 = 6
   4) 5 + 1 = 6

9. In which of these examples should the question mark be a plus sign?
   1) 4 ? 3 = 7
   2) 8 ? 2 = 4
   3) 9 ? 5 = 4
   4) 3 ? 2 = 6

11. Which of these pictures shows how to divide 12 marbles equally among 3 boys?

31. Bruce made a mistake in working one of these examples. Which example has the wrong answer?
   1) 4 ÷ 1 = 4
   2) 4 + 0 = 4
   3) 4 - 0 = 4
   4) 4 × 0 = 4

32. In the number 1736, which figure means tens?
   1) 1
   2) 7
   3) 3
   4) 6

33. On March 3 Ann said, “I will be eight years old in just one week.” On what date is her birthday?
   1) March 8
   2) March 10
   3) March 11
   4) March 13

34. In the picture, how long is the line above the ruler?
   1) 1 inch
   2) 1 and one-quarter inches
   3) 1 and one-half inches
   4) 2 and three-quarters inches

35. What is the smallest number that can be written by using the figures 7, 2, 4, and 1 once each?
   1) 1247
   2) 1724
   3) 1274
   4) 1427

36. Jerry listens to his favorite radio program each afternoon at 5:15. At the time shown by this clock, how many minutes must he wait for the program to begin?
   1) 8
   2) 20
   3) 22
   4) 32
37. Jane bought a coin purse for 50¢ and gave the clerk a dollar. How would the clerk count Jane's change?
   1) 58¢, 59¢, 60¢, 65¢, 75¢, $1.00
   2) 58¢, 63¢, 73¢, 74¢, 75¢, $1.00
   3) 58¢, 68¢, 73¢, 74¢, 75¢, $1.00
   4) 58¢, 59¢, 60¢, 85¢, 90¢, $1.00

38. In which of these addition exercises do you carry a ten?
   1) 43 2) 352 3) 241 4) 147
   \[ 43 + 72 = 115 \]
   \[ 352 + 164 = 516 \]
   \[ 241 + 128 = 369 \]
   \[ 147 + 235 = 382 \]

39. What part of this figure is shaded?
   1) \( \frac{3}{6} \)
   2) \( \frac{3}{4} \)
   3) \( \frac{3}{4} \)
   4) \( \frac{5}{6} \)

40. Eddie is 10 inches taller than a yardstick. How many inches tall is he?
   1) 34
   2) 40
   3) 46
   4) 58

41. How many hours is it from 12 o'clock noon until 12 o'clock midnight?
   1) 48
   2) 24
   3) 12
   4) 10

42. What does the Roman number XXXIV mean?
   1) 24
   2) 34
   3) 35
   4) 36

43. These groups of numbers show how Mary counted by 2's, 3's, 4's, and 5's. In which group did she make a mistake?
   1) 37, 39, 41, 43, 45
   2) 20, 23, 26, 30, 33
   3) 10, 14, 18, 22, 26
   4) 17, 22, 27, 32, 37

44. Which of these is an odd number?
   1) 122
   2) 21
   3) 21

45. Fred's father saw candy priced at 61.99 per lb. Which of these would be the best way to estimate the cost of 3 boxes?
   1) \$1.00 \times 3
   2) \$1.50 \times 3
   3) \$1.90 \times 3
   4) \$2.00 \times 3

46. If a number is divided by 7, what is the largest possible size the remainder may have?
   1) 6
   2) 7
   3) 8
   4) Larger than 8

47. Sally's mother opened a quart carton of milk and used 2 cups for cooking. How much milk left in the carton?
   1) 3 cups
   2) 1 cup
   3) 1 pint
   4) None

48. What temperature does this thermometer show?
   1) 61°
   2) 60°
   3) 59°
   4) 58°

49. Nancy's little sister is 16 months old. Which of these is another way to express her age?
   1) 1 yr. 6 mo.
   2) 1 yr. 4 mo.
   3) 1 yr. 2 mo.
   4) 1 yr. 4 mo.

50. In which of these exercises is the 10 a product?
   1) 10 \div 2 = 5
   2) 5 \times 2 = 10
   3) 6 + 4 = 10
   4) 2 \times 10 = 20

51. How would you find the average of the numbers 4, 2, 8, and 6?
   1) Add the numbers and divide the sum by 4.
   2) Add the numbers and multiply the sum by 4.
   3) Add the numbers and divide the sum by 4.
   4) Multiply each number by 4 and add the answers.

GRADE 4
1. In which pair are the fractions equal?
   1) \( \frac{3}{5}, \frac{3}{10} \)  
   2) \( \frac{3}{5}, \frac{6}{10} \)  
   3) \( \frac{3}{2}, \frac{3}{8} \)  
   4) \( \frac{3}{5}, \frac{6}{10} \)

2. Which group of fractions is arranged in order of size from largest to smallest?
   1) \( \frac{1}{6}, \frac{1}{4}, \frac{1}{8} \)  
   2) \( \frac{1}{5}, \frac{1}{4}, \frac{1}{2} \)  
   3) \( \frac{1}{3}, \frac{1}{6}, \frac{1}{5} \)  
   4) \( \frac{1}{2}, \frac{1}{3}, \frac{1}{8} \)

3. Which of these fractions has the largest numerator?
   1) \( \frac{3}{8} \)  
   2) \( \frac{1}{6} \)  
   3) \( \frac{5}{4} \)  
   4) \( \frac{2}{5} \)

4. Which group of fractions is arranged in order of size from largest to smallest?
   1) \( \frac{1}{5}, \frac{1}{4}, \frac{1}{2} \)  
   2) \( \frac{1}{6}, \frac{1}{4}, \frac{1}{8} \)  
   3) \( \frac{1}{3}, \frac{1}{6}, \frac{1}{5} \)  
   4) \( \frac{1}{2}, \frac{1}{3}, \frac{1}{8} \)

5. Which of these fractions is greater than 1?
   1) \( \frac{3}{5}, \frac{3}{8} \)  
   2) \( \frac{5}{4} \)  
   3) \( \frac{4}{3} \)  
   4) \( \frac{4}{5} \)

6. Which of these is the greatest weight?
   1) 1 lb. 10 oz.  
   2) 1 lb. 14 oz.  
   3) 1.5 lb.  
   4) 1.5 oz.

7. Which of these addition examples is represented by the shaded parts of the diagrams below?
   1) \( \frac{1}{4} + \frac{1}{4} \)  
   2) \( \frac{3}{6} + \frac{3}{6} \)  
   3) \( \frac{3}{6} + \frac{1}{4} \)  
   4) \( \frac{1}{3} + \frac{1}{4} \)

8. Which of these is a pair of like fractions?
   1) \( 1, 1 \)  
   2) \( 1, 2 \)  
   3) \( 6, 4 \)  
   4) \( 3, 6 \)

9. In which pair are the fractions equal?
   1) \( \frac{2}{3}, \frac{4}{6} \)  
   2) \( \frac{3}{5}, \frac{6}{10} \)  
   3) \( \frac{3}{2}, \frac{3}{8} \)  
   4) \( \frac{3}{5}, \frac{6}{10} \)

10. Which of these addition examples is represented by the shaded parts of the diagrams below?
    1) \( \frac{1}{4} + \frac{1}{4} \)  
    2) \( \frac{3}{6} + \frac{3}{6} \)  
    3) \( \frac{3}{6} + \frac{1}{4} \)  
    4) \( \frac{1}{3} + \frac{1}{4} \)

11. Which of these is the greatest distance?
    1) 2 yd.  
    2) 3 ft. 2 in.  
    3) 42 in.  
    4) 1 yd. 2 ft.

12. Which of these fractions is greater than 1?
    1) \( \frac{3}{4} \)  
    2) \( \frac{5}{4} \)  
    3) \( \frac{4}{3} \)  
    4) \( \frac{4}{5} \)

13. If 183 is rounded off to the nearest ten, what is the resulting number?
    1) 180  
    2) 182  
    3) 190  
    4) 200

14. The plate in an elevator reads, "Capacity 4000 lb." How many tons will the elevator carry safely?
    1) 1  
    2) 2  
    3) 4  
    4) 8

15. Which of these is a pair of like fractions?
    1) \( 1, 1 \)  
    2) \( 1, 2 \)  
    3) \( 6, 4 \)  
    4) \( 3, 6 \)

16. Which of these addition examples is represented by the shaded parts of the diagrams below?
    1) \( \frac{1}{4} + \frac{1}{4} \)  
    2) \( \frac{3}{6} + \frac{3}{6} \)  
    3) \( \frac{3}{6} + \frac{1}{4} \)  
    4) \( \frac{1}{3} + \frac{1}{4} \)

17. Which of these is the greatest distance?
    1) 2 yd.  
    2) 3 ft. 2 in.  
    3) 42 in.  
    4) 1 yd. 2 ft.

18. Which of these fractions is greater than 1?
    1) \( \frac{3}{4} \)  
    2) \( \frac{5}{4} \)  
    3) \( \frac{4}{3} \)  
    4) \( \frac{4}{5} \)

19. If 183 is rounded off to the nearest ten, what is the resulting number?
    1) 180  
    2) 182  
    3) 190  
    4) 200
68. Which of these expressions is a mixed number?
1) \( \frac{2}{4} \)  
2) \( \frac{3}{5} \)  
3) \( \frac{1}{3} \)  
4) \( \frac{7}{6} \)

69. Which of these pairs of fractions has 12 for a common denominator?
1) \( \frac{1}{4}, \frac{3}{8} \)  
2) \( \frac{3}{5}, \frac{1}{2} \)  
3) \( \frac{1}{5}, \frac{2}{3} \)  
4) \( \frac{1}{2}, \frac{3}{4} \)

70. How would you write five hundred six thousand seventy-two in figures?
1) 506,072  
2) 506,702  
3) 506,072  
4) 506,702

71. Which of these fractions can be reduced by using 3 as a divisor?
1) \( \frac{8}{13} \)  
2) \( \frac{5}{16} \)  
3) \( \frac{12}{18} \)  
4) \( \frac{7}{21} \)

72. Which of the subtraction exercises below is worked correctly?
1) \( \frac{5}{6} \)  
2) \( \frac{2}{3} \)  
3) \( \frac{7}{8} \)  
4) \( \frac{1}{4} \)

73. The automobile distance from Chicago to York is about 800 miles. Which of these explains the meaning of "about 800 miles"?
1) Slightly more than 800 miles  
2) Slightly less than 800 miles  
3) Exactly 800 miles  
4) Either slightly more or slightly less than 800 miles

74. Which of these distances along the ruler below is 2\( \frac{1}{4} \) in.?
1) A to B  
2) A to C  
3) A to D  
4) A

75. Which of these is a correct way to find a fraction equal to \( \frac{4}{6} \)?
1) \( \frac{4}{6} = \frac{4 \times 2}{6 \times 2} = \frac{8}{12} \)  
2) \( \frac{4}{6} = \frac{4 + 2}{6 + 2} = \frac{6}{8} \)  
3) \( \frac{4}{6} = \frac{4 - 2}{6 - 2} \)  
4) \( \frac{4}{6} = \frac{4 \div 2}{6 \div 2} \)

76. Which of these is a correct way to find perimeter of the figure below?
1) 2 \times 10  
2) 6 + 8  
3) 6 \times 8  
4) 6 + 8 + 6 + 8

77. The average of 4 numbers is 12. What is the sum?
1) 48  
2) 36  
3) 24  
4) 12

78. If 13.48 is rounded off to the nearest whole number, what is the result?
1) 10  
2) 13  
3) 14  
4) 1

79. Which of these reductions in the price of an article would result in the greatest saving for the customer?
1) \( \frac{1}{4} \text{ off} \)  
2) \( \frac{1}{5} \text{ off} \)  
3) \( \frac{1}{3} \text{ off} \)  
4) \( \frac{1}{10} \text{ off} \)

80. Broadcast time for a Thanksgiving Day football game in Minneapolis is 1:15 P.M. At what time should a person in New York tune in for broadcast?
1) 2:15 P.M.  
2) 1:15 P.M.  
3) 12:15 P.M.  
4) 11:15 A.M.
Problem Solving

Directions: This is a test of your skill in solving arithmetic problems.

The problems in the test are like the samples shown at the right. After each problem are three possible answers and a "Not given" — meaning that the correct answer is not given. If the correct answer is not given, fill in the circle on the answer sheet that has the same number as the right answer. If the correct answer is not given, fill in the fourth circle.

The sample exercises show you what to do.

Use this table to find where your grade is to begin and stop on this test.

1. Tony had 27 marbles. His father gave him a bag of 12 marbles. How many marbles did Tony have then?
   1) 15  2) 29  3) 39  4) (Not given)

2. Benny had 13 marbles. He traded 4 to Tony for a pencil. How many marbles did Benny have then?
   1) 9  3) 17

3. On Tuesday Miss Lee began to read a story to the third grade. She read 6 pages on Tuesday, 4 on Wednesday, 5 on Thursday, and 4 on Friday. How many pages of the story did she read that week?
   1) 15  3) 19  2) 18  4) (Not given)

4. The third-grade pupils were reading animal stories. They had 12 books about animals in the schoolroom. Miss Lee brought 5 others from the library. How many books about animals did they have then?
   1) 5  3) 12  2) 7  4) (Not given)
To work problems 5 - 10, look at the picture above to find the prices of things. Do not allow for sales tax.

5. Kathy bought a pencil, an eraser, and a notebook. How much did she pay in all?
   1) 17¢  2) 18¢  3) 19¢  4) (Not given)

6. How much did Steve pay for a jar of paste and a pair of scissors?
   1) 13¢  2) 35¢  3) 37¢  4) (Not given)

7. How much more did Wanda have to pay for a box of paints than for a box of crayons?
   1) 9¢  2) 11¢  3) 47¢  4) (Not given)

8. Paul bought a ruler and paid for it with a quarter. How much change did he receive?
   1) 12¢  2) 13¢  3) 37¢  4) (Not given)

9. How much did Joyce have to pay for a tablet and an eraser?

10. Ned bought a box of crayons and a pencil. How much did they cost?
    1) 14¢  2) 24¢  3) $1.14  4) (Not given)

11. The third grade had a picnic in the park. The school bus took 25 of the 32 pupils. The others went in cars. How many pupils went in car?
    1) 7  2) 13  3) 17  4) (Not given)

12. The children gave most of the food for the picnic. The class paid $2.24 for ice cream and $1 for pop. How much did the class spend?
    1) $3.24  2) $3.40  3) $3.44  4) (Not given)
One Saturday David visited his Uncle Henry's farm. He helped by gathering the eggs in the two hen houses. He got 68 eggs in one house and 49 in the other. How many eggs in all did he gather?

1) 107
2) 115
3) 117
4) (Not given)

David's uncle told him to fill 3 cartons with eggs to take home. Each carton held 12 eggs. How many eggs did David take home?

1) 9
2) 12
3) 15
4) (Not given)

The school nurse measured the height of each third-grade pupil. The tallest boy was 56 inches. The shortest boy was 42 inches. What was the difference in their heights in inches?

1) 4
2) 13
3) 14
4) (Not given)

Joan weighed 48 pounds. The school nurse said, "Joan, you are 7 pounds underweight." How many pounds should she have weighed?

1) 55
2) 45
3) 41
4) (Not given)

Mike weighed 58 pounds. When the nurse looked at his health record for last year, she found that he had gained 5 pounds. How many pounds did Mike weigh last year?

1) 53
2) 54
3) 63
4) (Not given)

The health records for the third-grade pupils showed that 12 boys and 9 girls had had chicken pox. How many third-grade pupils had had chicken pox?

1) 17
2) 21
3) 22
4) (Not given)

Bobby's brother sent him 29 German stamps. He already had 7 stamps from that country. How many German stamps did he have then?

1) 22
2) 26
3) 35
4) (Not given)

Dick had 15 airmail stamps and Bobby had 28. How many more airmail stamps did Dick need to equal Bobby's collection?

1) 28
2) 13
3) 3
4) (Not given)

Bobby bought a package of 42 Japanese stamps. He found that 8 were exactly like stamps already in his collection. He gave these to Dick. How many stamps did Bobby keep from the package?

1) 34
2) 46
3) 50
4) (Not given)

Lucy planned a birthday party for her sister, Janet. Janet was 8 years old. Lucy was 7 years older. How old was Lucy?

1) 7
2) 13
3) 15
4) (Not given)

Lucy had $4.75 to spend for Janet's party. Their mother baked the cake. The napkins and favors cost $2.70. How much could Lucy spend for ice cream?

1) $2.05
2) $2.75
3) $4.75
4) (Not given)

Lucy cut the cake into 24 pieces. She served ice cream and cake to 16 children. How many extra pieces of cake did Lucy have?

1) 8
2) 12
3) 18
4) (Not given)

Janet's aunts gave her money for her birthday. Aunt Mary gave her 50¢ and Aunt Kate gave her 75¢. How much money did Janet receive?

1) $1.15
2) $1.20
3) $1.25
4) (Not given)
To work problems 26 - 31, look at the picture above to find the prices of things. Do not allow for sales.

26. Pete chose a pork chop, milk, peas, and pie for his lunch. How much did his lunch cost?
   1) 38¢  2) 47¢  3) 48¢  4) (Not given)

27. Alan wanted 2 hot dogs and an apple for his lunch. He had only a quarter. How much money would he need to borrow?
   1) 3¢  2) 9¢  3) 19¢  4) (Not given)

28. For dessert Dorothy bought 4 cookies and ice cream. How much did she pay for dessert?
   1) 13¢  2) 18¢  3) 28¢  4) (Not given)

29. Ralph bought ice cream for himself and the four other boys at his table. How much did the ice cream cost?
   1) 22¢  2) 40¢  3) 54¢  4) (Not given)

30. Linda's lunch included soup, 2 cheese wiches, salad, and ice cream. How much did lunch cost?
   1) $30¢  2) $40¢  3) $55¢  4) (Not given)

31. Miss White reported that 27 of the 32 pupils in her room bought milk for lunch. How much did they pay in all for milk?
   1) $1.22  2) $1.62  3) $1.92  4) (Not given)

32. The fourth grade was studying about lion tigers. Doris found 4 stories about these animals. Rose found 3 times as many as Doris. How many stories did Rose find?
   1) 3  2) 7  3) 9  4) (Not given)
34. Art read that a cattle-eating tiger kills a cow about every 5 days, sometimes oftener and sometimes not that often. About how many cattle would one of these tigers kill in a year? (1 year = 365 days)
1) 80 2) 70 3) 60 4) 50

35. Jim had 60 customers on his paper route. Friday evening his brother carried 1/4 of the papers so they could go to the early movie. How many papers did Jim's brother carry?
1) 20 2) 23 3) 30 4) (Not given)

36. Tom had 47 customers on his morning paper route. If he received 7¢ a week for delivering the papers to each customer, how much did he earn each week on his paper route?
1) $2.89 2) $3.29 3) $3.39 4) (Not given)

37. Hugh and Alice went with their father to buy a Christmas tree. It cost $2.39. Their father paid the clerk with a five-dollar bill. How much change should he have received?
1) $2.61 2) $2.71 3) $3.39 4) (Not given)

38. Alice bought some new decorations for the Christmas tree. She paid 98¢ for a can of snow spray, 13¢ for a package of angel hair, 25¢ for a large box of icicles, and 29¢ for a package of Christmas rope. How much did she pay in all for these decorations?
1) $1.55 2) $1.64 3) $1.65 4) (Not given)

39. Hugh spent 76¢ for 4 Christmas tree light bulbs. How much did he pay for each light bulb?
1) 19¢ 2) 18¢ 3) 14¢ 4) (Not given)

40. Lincoln school collected money for the Junior Red Cross. Each of the 29 pupils in the fourth grade gave 15¢. How much did the fourth-grade pupils give altogether?
1) $1.45 2) $3.95 3) $4.35 4) (Not given)

41. The fifth grade passed a collection box, and each pupil gave as much as he wished. The total amount in the box was $5.76. If there were 32 pupils in the fifth grade, what was the average amount each gave?
1) 13¢ 2) 18¢ 3) 32¢ 4) (Not given)

42. About 1/4 of the money collected in the city schools for the Junior Red Cross was given by the pupils in Lincoln School. They gave $29.67. About how much did all of the city schools give?
1) $10.00 2) $60.00 3) $70.00 4) $90.00

43. Mrs. Richards, Ted, and Diana made a train trip from Chicago to New York City. Diana, who was 10 years old, rode for half fare. If the round-trip full fare was $52.26, how much did the round-trip ticket for Diana cost?
1) $21.13 2) $26.03 3) $26.13 4) (Not given)

44. The total round-trip fare for Mrs. Richards and the two children was $130.65. If they had been able to use a special family-travel plan, they could have saved $78.39. How much would they have saved?
1) $52.26 2) $52.36 3) $62.26 4) (Not given)

45. On the route they traveled, the distance from Chicago to Pittsburgh was 468 miles; from Pittsburgh to Harrisburg, 245 miles; from Harrisburg to Philadelphia, 109 miles; and from Philadelphia to New York City, 86 miles. How many miles was it from Chicago to New York City by this route?
1) 898 2) 907 3) 908 4) (Not given)

46. It took 9 hours to go the 468 miles from Chicago to Pittsburgh. What was the average speed of the train in miles per hour for this part of the trip?
1) 50 2) 52 3) 62 4) (Not given)

47. Mrs. Richards and the children had dinner on the train. Diana and her mother each chose the $1.50 plate dinner and Ted the $2.75 dinner. What was the total cost of the meal?
1) $4.70 2) $5.65 3) $6.55 4) (Not given)
50. Kenny's brother had just joined the Cub Scouts. His father gave him $5.00 to buy his outfit. He bought a cap for $1.10, a shirt for $2.95, a neckerchief for 55¢, and a neckerchief slide for 12¢. How much money did he have left?
1) $2.82 2) $3.82 3) $1.28 4) (Not given)

51. Kenny is saving 80¢ each week to buy a Cub-Scout knife. The knife costs $1.50. If he now has 90¢, how many more weeks must he wait before he can buy the knife?
1) 5 2) 3 3) 2 4) (Not given)

52. Mr. Stone bought a flash camera outfit for Jerry and Judy. He paid $7.20 for the camera, $3.65 for a flash unit, $1.38 for 3 rolls of film, and $1.04 for 8 flash bulbs. How much did Mr. Stone pay for the outfit?
1) $12.27 2) $13.27 3) $13.38 4) (Not given)

53. Jerry paid $2.04 for a roll of color film. The cost included developing the film and making one print for each of the 12 pictures. How much did each color picture cost?
1) 17¢ 2) 18¢ 3) 22¢ 4) (Not given)

54. Jerry and Judy sent 3 rolls of film to the photo shop for developing and printing. There were 12 exposures on each roll. If five of the pictures were not clear, how many pictures were good?
1) 31 2) 21 3) 7 4) (Not given)

APPENDIX V

INFORMAL READING INVENTORY
Kim and Wendy look and look. It is fun to look for a toy.

"Here is a blue toy," said Kim.
"Here is a big blue toy for you."

Wendy said, "A big toy! I do not want a big toy. I want a little toy. I do not see what I want."
Soon the Shoe Man looked up. He saw something.

"Look, Freddie," he said
"My kitten likes to play with old shoes.
Do you see what I see?"

"Oh, oh," said Freddie.
"It is my old shoe.
The little kitten had my shoe."
By and by a man came out of the farm house. He was looking for a duck to eat. The man looked at Sonny.

"Oh, there is a good duck," said the man.

"A good duck to eat."

The other ducks laughed. But not Sonny. Oh, no, not Sonny!
One day Mr. Brooks said to his family, "Mary and George are growing up. This apartment is too little for us. It is time to find a house."

So Mr. Brooks looked for a house. At last he found one in a town not far from Harbor City.

"Lots of oak trees grow there," he told his family. "In the fall the oak leaves turn red. So the town is called Red Oaks. I hope you will like it."

Then Mr. Brooks showed his family a picture of the new house. It was white, with a blue door and a red chimney. The picture showed a swing in a big tree.
One February afternoon I was walking my bicycle carefully along Maple Street, trying to keep off the icy spots. Coming around the corner for all he was worth was Don Welch. Don knew about that ice, but today his mind seemed to be a thousand miles away.

He started to pedal straight across the ice. When he had pedaled a few feet, his bicycle suddenly slipped from under him and went spinning across the ice. The show lasted for about fifty feet. Then Don’s head tunneled into a snowbank near a telegraph pole.

I began to laugh. But Don wasn’t laughing. Neither was I when I saw him come out of the snowdrift. He looked as cheerful as a rain cloud as he crawled toward his bicycle.

"Here, let me help you, Don," I said.

"Stand back, Stephen Piper," he warned. "You don’t dare hinder one of Sam’s boys."
A wind swept across Lake Henry, stretching the sail of the catboat. Jimmy Johnson sat in the stern of the *Eager Beaver*, one hand on its tiller.

Jimmy loved sailing. His mother said it must be his Norwegian blood. Jimmy wished he had lived long ago when Norwegian sailors had battled the Atlantic. They surely had their problems!

Jimmy had a problem, too. It was his cousin from Nevada, now perching near by. Oliver was tall and thin, with huge, humorless eyes behind heavy rimmed spectacles. As usual, he was reading a book.

"Look, Oliver," said Jimmy. "Thanks for offering to be my crew in the race Saturday, but I know you don't want to. So I'll get Don Shepherd instead."

"No, James," Oliver replied in a way that Jimmy usually connected only with professors. "I will be delighted to go along and assist you. By Saturday I will be a regular sailor, for I will have impressed upon my mind the information in this manual."
But the glory of the heavens first burst forth when Galileo trained his spyglass on the Milky Way. People had wondered about the bluish-white streak that ran like a ribbon across the canopy of the heavens.

Galileo answered their inquiries by saying, "Millions of stars, too far away to be seen by the eye alone!"

The world was breathless with excitement. Galileo was discovering the hidden universe. But the most inspiring spectacle came on the night of January 7, 1610. The discoverer, that night, turned his attention to the planet Jupiter. He was surprised to see three bright stars near the planet. The next night he found that those three stars were all on the same side of Jupiter.

Galileo was elated. And what was his excitement when one of the stars disappeared around the edge of the planet! Later he saw from his conservatory four stars where before there had been only three.

"There are four moons wheeling around Jupiter," Galileo announced, no longer in doubt.
The half-bent figure suddenly straightened. The orchestra, holding its breath for one tense moment, waited for the initial down beat. I was holding my breath, too, as I stood watching from the corner of my eye the profile of the conductor.

The poised baton signaled its first decisive command. Four detached raps of the kettledrum modestly announced the opening of this Beethoven masterpiece, the most serene of all violin concertos. Unique from his pen, it reflects, perhaps, the one unclouded period of that master's life. With the Fourth Symphony and the G-major Piano Concerto it shares a confident faith in what life promised to hold for him.

The long orchestral introduction which precedes the soloist's first entrance is at once a challenge and an invitation: a challenge to the nerves and an invitation to memory. Waiting your cue, you relive the past and anticipate the future with a kind of lightning rapidity; the spur of heightened excitement lifts your imagination over the barriers of time and space. At least, it was so for me.
Page 38 (53 words)

Motivation: Have you ever been in a toy store? Did you buy a big toy or a little one? Let's see what happened in this story.

Comprehension check:

I 1. What happened in this story?
F 2. What did Wendy want?
I 3. What kind of toy do you think Wendy will take?
F 4. What color toy did Kim want Wendy to have?
I 5. What shows that Kim and Wendy were kind to each other?

Responses:

Kim and Wendy went to a toy store to buy a toy.
A little toy
Any answer
A blue toy
They thought of each other.

Primer: Up the Street and Down

Page 69 (42 words)

Motivation: Did you ever lose something and then have a surprise when you found it? That's what happened to little Freddie in our story.

Comprehension check:

I 1. What is the story about?
F 2. When did the man see the kitten?
F 3. Whose kitten was it?
F 4. What did the kitten like to play with?
I 5. What happened to the old shoe?
F 6. To whom did the old shoe belong?
I 7. How do you think Freddie felt about what the kitten did?

Responses:

A lost shoe
When he looked up
The Shoe Man's
Old shoes
The kitten took it up onto a shelf
Freddie
He didn't care, or he thought it was a good joke.
Motivation: This is a story about a family who is moving to a new home.

Comprehension check:

F 1. What were the names of Mr. Brooks' children?
I 2. Why was Mr. Brooks looking for a house?
I 3. Was it easy to find a new home?
F 4. Where was the new home located?
F 5. Why was the town called Red Oaks?
I 6. Do you think the Brooks family will like to live in the new house?
V 7. How does an apartment differ from a house?
F 8. How did the family know what the new house would look like?
F 9. What three colors describe the new house?
I 10. What is something about the new house the children will like?

Responses:

1. Mary and George
2. the apartment was too small
3. not too easy: "at last"
4. not far from Harbor City
5. in fall the oak leaves turn red
6. yes; more convenient, larger, attractive
7. usually smaller; many homes together
8. Mr. Brooks showed them a picture
9. red, white and blue
10. the swing
Motivation: Have you ever moved to another city? Can you imagine how this little boy felt when his family moved to another section of our country? Let's read this part of the story to find out how this family built their new home.

Comprehension check:

I 1. In what section of the U.S. do you think this story takes place?

V 2. What is the "rolling prairie"?

F 3. With what did Mr. Kimball build the house?

F 4. What held the pieces of earth together?

F 5. Find the part that tells how the walls were made.

F 6. Why didn't Mr. Kimball use logs for his house?

F 7. After the house was built, what other important work did Mr. Kimball have to do?

V 8. How would Mr. Kimball "till" the land?

I 9. Explain how long this house would last.

F 10. Find the part that tells you Mr. Kimball was not too satisfied with his new house.

Responses:

1. middle west states

2. stretches of flat land

3. pieces of earth

4. grass roots

5. pieces were placed on top of one another

6. because there were no trees

7. till the land and plant the crops

8. he would use a sharp instrument to dig up the land

9. Not very long because the rains would wash away the mud

10. "We will build a better house later."

Motivation: Do you have any idea of what would happen when a bike and an ice street get together?

Comprehension check:

I 1. What would be a good name for this page of the story?

F 2. What is the setting, time and place, for this story?

I 3. Why did Don happen to slide on the ice?

F 4. How far had Don been riding before his bicycle slipped?

F 5. Why didn't Stephen fall as Don did?

F 6. What happened when Don's bicycle slipped from under him?

I 7. What kind of a disposition did Don have when he came out of the snow drift?

F 8. What did Don say when Stephen wanted to help him?

V 9. Give another word for hinder and use it in a sentence.

Responses:

1. Disaster on Ice

2. February afternoon on Maple Street

3. he was thinking about something else

4. a few feet

5. he was walking his bike

6. he tunneled into a snowbank

7. an unpleasant one

8. "don't hinder one of Sam's boys."

9. stop; prevent
Book Five: Adventures Here and There

Page 294 (169 words)

**Motivation:** Have you ever sailed a boat? Where would you get information about sailing? Read this story to find out if these boys had any knowledge of sailing a boat.

**Comprehension check:**

1. What is the name of this sailboat?
2. From the picture, what idea would you have of a catboat?
3. Where is the "stern" of a boat?
4. What is a "tiller"?
5. What problem did Jimmy have?
6. What sort of boy was Oliver?
7. What do you think is meant by the expression that Oliver had huge, humorless eyes?
8. How did Jimmy feel about having Oliver as his crew?
9. Find the part that tells what Jimmy said that makes you think he didn't want Oliver.
10. Do you think from Oliver's answer that he will be a help or a hindrance in the race?

Responses:
1. Eager Beaver
2. small sailboat with one large sail
3. back part of a boat
4. handle that guides the boat
5. his cousin from Nevada
6. tall, thin, wore heavy-rimmed spectacles; a great read
7. dreamy, lifeless eyes
8. He thought he would be of no help
9. "Thanks for offering ... instead."
10. maybe he will be a big help because of the information he has gathered

Book Six: Adventures Now and Then

Page 295 (166 words)

**Motivation:** The study of the sky and bodies in outer space have always been of interest to men. Galileo was one of these men. Find out what he discovered.

**Comprehension check:**

I 1. How do you know that Galileo was not the only one to notice the Milky Way?
2. What is another word for sky?
3. What did Galileo use to see the Milky Way?
4. How did the Milky Way look?
5. How did the people feel about the discoveries?
6. What two discoveries did Galileo make?
7. In what year did Galileo discover that Jupiter had four moons?
8. What showed that the heavenly bodies move?
9. What is a conservatory?
10. What does the phrase "wheeling around"

Responses:
1. People had wondered about the bluish-white streak
2. heavens
3. spyglasses
4. like a ribbon
5. breathless with excitement
6. the Milky Way consists of millions of stars; Jupiter has four moons
7. 1610
8. one of the stars disappeared around the edge of the planet
9. place of study or work
10. moving in a circular direction
This is a story that any boy and girl will enjoy because of the kind of people in it.

Comprehension check:

F 1. What injury had the boy received?

I 2. How do we know that the boy was young?

F 3. What three things did he foresee as his future?

V 4. What is gangrene?

V 5. Explain: "he lay on the field of agony".

I 6. What emblem replaced the old yellow hospital flag on the battlefield?

F 7. What pleasant and unexpected joy did the boy experience?

F 8. Describe Clara Barton as he saw her.

V 9. Give a synonym for save in the second paragraph.

F 10. Why had Clara been loved by children?

Responses:

His right arm was mangled.

He was not long out of school.

The enemy might find him; the surgeon might operate with un­clean instruments; he would be­come ill in a prison camp.

Decayed tissue

He was suffering intensely; dying.

The blood-bright emblem of the Red Cross.

Clara Barton, his former teacher came to him.

Like an angel; dark compassion­ate eyes; long, tender mouth; hands like his mother's.

Except

Low, sweet voice; never punished; was a friend to all.

Book Eight: Worlds of People

Motivation: Find out how you would like to have been in the author's place.

Comprehension check:

I 1. What was the author describing?

I 2. Why could the author be watching the con­ductor at the opening of the selec­tion?

F 3. By whom was the masterpiece written?

V 4. Which word means that this selection was not like his ordinary ones?

I 5. What was the theme of the masterpiece?

F 6. How is the soloist's entrance both a challenge and an invitation?

V 7. What is a cue?

F 8. What does the soloist do while waiting for his turn to play.

F 9. What made the author forget time and space?

F 10. Is this a story of fact or opinion?

Responses:

A soloist's first appearance with an orchestra

He didn't play until later.

Beethoven

Unique

What life held for the author.

A challenge to the nerves; an invitation to the memory

A signal to do something.

Relives the past; anticipates the future

Great excitement

Opinion.
